11:05 Invited talk Need for Speed in functional and structural in-vivo optical coherence tomography <u>R.A. Leitgeb;</u> Center for Medical Physics and Biomedical Enginee- ring, Medical University Vienna (AT). During the last twenty years the most impressive figure of techno- logical advancement in optical coherence tomography has cer- tainly been speed. First time domain OCT systems operated at a few tens of depth scans per second. Within a few years this improved to a few thousand scans per second however at the expense of depth range, axial resolution, and sensitivity. Whereas for time domain OCT this marked already the maximal achievable scan rate for imaging of biological tissue, Fourier do- main OCT allowed for a quan- tum leap in imaging speed by several orders of magnitude. This was supported by technological developments of high-speed sensors as well as light sources. In particular wavelength swept lasers boosted the speed per- formance during the last years. Short cavity lasers are nowa- days commercially available with 100KHz A-scan rates. With the principle of Fourier domain mode locking for wavelength tuning sources even MHz A-scan rates could be achieved. [6211] Pg. 3		11:05 STUDENT PRESENTATION Comb photonic crystal waveguides <u>C. Caer</u> , X. Le Roux, E. Cassan; Institut d'Electronique Fondamen- tale, Univ. Paris-Sud, CNRS (FR). We introduce a novel design of wide Slot Photonic Crystal Waveguides (SPCW) by tailor- ing the slot into a comb. This allows performing dispersion engineering in order to achieve slow light regime. This kind of device opens perspectives to realize nonlinear operating de- vice by providing an ultra-high optical density while easing the filling of the slot due to its width. [5974]Pg. 5	11:05 Invited talk Optotune tunable lenses and laser speckle reducers <u>C.F. Graetzel</u> , M. Aschwanden; Optotune (CH). This talk will cover tunable lens and laser speckle technology developed at Optotune. Soft polymers are employed to cre- ate adaptive optical components for applications in fields as di- verse as imaging, projection and ophthalmology. [6066]Pg. 7

11:05 Invited talk Organic Small Molecules for Photonic Applications: From Solar Cells to Micro Lasers <u>R. Brückner</u> , A.A. Zakhidov, M. Sudzius, R. Scholz, S.I. Hint- schich, H. Fröb, V.G. Lyssenko, K. Leo, Institut für Angewandte Photophysik, TU Dresden (DE). In this presentation, we summa- rize the progress on optoelec- tronic devices based on organic small molecules. We discuss the recent progress in efficiency and lifetime for organic LEDs and organic solar cells. We cover in detail recent work on novel laser structures: With organic micro- cavities containing metallic lay- ers a novel class of hybrid de- vices is investigated. The high quality and low residual absorp- tion of these structures enables us to investigate remarkably mode structures and various coherent phenomena. [6016]Pg. 9	11:05 Invited talk Modulation and propagation of high density polariton states M.S. Skolnick: Department of Physics and Astronomy, University of Sheffield (GB). New physics observed in high density polariton systems in semi- conductor microcavities will be described. As well as a general overview, attention will be focus- sed on recent work on polariton condensates in periodic poten- tials, and the observation of single and multiple polariton soliton phenomena, in both cases stressing the importance the highly non-linear behaviour which underlies polariton physics. [5963]Pg. 11	11:05 Invited talk Optical Measurement Technolo- gles for the Oil and Gas Industry <u>D. McStay</u> , MCSC Ltd. (GB). The range of optical technolo- gies that have been deployed or are being investigated for meas- urement applications within the oil and gas industry will be re- viewed. Factors that impact on the successful adoption of optical technologies will be outlined. [6115]Pg. 13

NOTES

11:35 Inter-B-scan Phase-Resolved **Optical Frequency Domain Imag**ing of the Retina and Choroid B. Braaf<sup>1</sup>, K.A. Vermeer<sup>1</sup>, K.V. Vienola<sup>1</sup>, J.F. de Boer<sup>1,2</sup>; <sup>1</sup>Rotterdam Ophthalmic Institute (NL), <sup>2</sup>VU University, Department of Physics and Astronomy (NL). Low blood flow velocities are hard to visualize with conventional phase-resolved optical coherence tomography. In this paper this problem is solved by phasedifference calculation from B-scans instead of successive A-scans. The vascular networks of the retina and choroid are visualized in a healthy volunteer. [6193].....Pg. 15

11:50 **STUDENT PRESENTATION** Imaging of laser induced temperature increase in biological tissue via phase sensitive Optical Coherence Tomography H. Spahr<sup>1</sup>, H. Müller<sup>2</sup>, L. Rudolph<sup>1</sup>, C. Hain<sup>2</sup>, R. Birngruber<sup>1,2</sup>, G. Hüttmann<sup>1,2</sup>; <sup>1</sup>University of Lübeck, Institute of Biomedical Optics (DE), <sup>2</sup>Medical Laser Center Lübeck GmbH (DE). Phase sensitive OCT enables the measurement of thermal expansion in laser irradiated tissue. From this the spatial temperature distribution and its temporal evolution can be estimated. This is demonstrated experimentally in silicone phantoms and enucleated porcine eyes. The thermal expansion of retinal tissue during photocoagulation is compared to optoacoustically measured temperatures. [6144].....Pg. 17

#### Room: Gordon B TOM 3 11:20 Coupling photonic crystal nano-

cavities in optical near-field field L. Lalouat<sup>1</sup>, B. Cluzel<sup>1</sup>, K. Foubert<sup>1,2</sup>, J. Dellinger<sup>1</sup>, E. Picard<sup>2</sup>, E. Hadji<sup>2</sup>, D. Peyrade<sup>3</sup>, F. de Fornel<sup>1</sup>; <sup>1</sup>Groupe d'Optique de Champ Proche, LRC CEA n°08-36, Laboratoire Interdisciplinaire Carnot de Bourgogne, UMR CNRS n°6303-Université de Bourgogne (FR), <sup>2</sup>Laboratoire Silicium Nanoélectronique Photonique et Structures, INAC/ SP2M/SiNaPS, CEA (FR), 3Laboratoire des Technologies de la Microélectronique, CNRS (FR). Combining several high quality (high Q) factor and small volume (small V) nanocavities together may open innovative ways to control the light properties at the wavelength or the subwavelength scale. [6056].....Pg. 19

#### 11:35 Strong lateral optical confinement in vertical microcavities

<u>F. Ding</u>, T. Stoferle, A. Knoll, R.F. Mahrt; IBM Research Zurich (CH). We propose that lateral photon confinement in a vertical Fabry-Perot microcavity resonator can be engineered by designing submicron-sized defects inside the cavities. The enhanced threedimensional confinement leads to a cavity mode volume of  $\sim (\lambda/n)^3$ while maintaining a quality factor of  $\sim 10^5$ . [5999].....Pg. 20

#### Metallic nanostructures on ferroelectric domain patterns in laser crystals

E. Yraola, <u>P. Molina</u>, M.O. Ramírez, J.L. Plaza, C. de las Heras, L.E. Bausá; Dpto. Física de Materiales and Instituto Nicolas Cabrera, Universidad Autónoma de Madrid (ES).

Alternate ferroelectric domain structures in Nd<sup>3+</sup> doped and pure LiNbO<sub>3</sub>:/MgO crystals are used as templates for the deposition of Ag metallic nanoparticles and Au thin films, respectively. The coupling between the surface plasmons and the optical properties of the ferroelectric substrates is demonstrated by the modification of both the emission of Nd<sup>3+</sup> ions in the substrate due to Ag nanoparticles, and the reflectivity of Au on the PPLN crystals. [5998].....Pg. 22

#### 11:35 STUDENT PRESENTATION Flexible and semi-automated characterization of tunable micro -lenses with variable apertures <u>P. Liebetraut</u>, P. Waibel, S. Petsch, B. Aatz, H. Zappe, University of Freiburg – IMTEK (DE).

To cope with various aperture sizes and changing focal lengths upon actuation of tunable microoptical devices, we present an aperture-variable measurement setup for transmissive wavefront sensing and focal length evaluation. The interferometer is also equipped with a Shack-Hartmann sensor for automated closed loop sensing. [5885].....Pg.24

#### 11:50 STUDENT PRESENTATION Simultaneous trapping and observation optics for microopto-fluidic systems

N. Sabitov, A. Grewe, S. Sinzinger, Technische Universität Ilmenau, Institute für Mikro- und Nanotechnologien IMN-MacroNano® (DE). We present an innovative optical system for optical manipulation of microparticles in a micro fluidic channel system. A specifically designed lens allows for simultaneously trapping and observation of the micro particles using digital holographic method. [6143]....Pg. 26

Room: Gordon A	Room 10	
TOM 6	TOM 7	NOTES

11:35 STUDENT PRESENTATION Nanoimprinted polymer lasers pumped by light-emitting diodes G.A. Turnbull<sup>1</sup>, <u>Y. Wang</u><sup>1</sup>, G. Tsiminis<sup>1</sup>, A.L. Kanibolotsky<sup>2</sup>, P.J. Skabara<sup>2</sup>, I.D.W. Samuel<sup>1</sup>, <sup>1</sup>Organic Semiconductor Centre, SUPA, School of Physics and Astronomy, University of St Andrews (GB), <sup>2</sup>WestCHEM, Department of Pure and Applied Chemistry, University of Strathclyde (GB).

We report the demonstration of the first UV-nanoimprinted organic lasers with thresholds under 1 kW/cm<sup>2</sup>, which enable them to be pumped by a pulsed light-emitting diode. We discuss optimised photonic designs for low threshold density lasing, and present the performance of these LED-pumped lasers. [6182] Pg. 28

#### 11:50

# Flexible organic semiconductor DFB microlaser array

B. Guilhabert<sup>1</sup>, N. Laurand<sup>1</sup>, A. Kanibolotsky<sup>2</sup>, P.J. Skabara<sup>2</sup>, M.D. Dawson<sup>1</sup>, <sup>1</sup>Institute of Photonics, University of Strathclyde (GB), <sup>2</sup>WestCHEM, Pure & Applied Chemistry, University of Strathclyde (GB). The fabrication of mechanically flexible organic semiconductor laser (OSL) arrays with micronsize cavity elements is presented. A disks format is used to physically define the distributedfeedback (DFB) cavities to diameters from 10 to 80µm. Single micron-  $80\mu m$  in size cavity laser emission at 534nm is demonstrated with threshold of  $0.4 \mu J$ (260µJ/cm2). [6124].....Pg. 30

Anderson Localization of

Surface-Plasmon Polaritons in

Arrays of Metallic Nanowires

F. Ye<sup>1</sup>, B. Malomed<sup>2</sup>, D. Mihala-

che<sup>3</sup>, <u>N.C. Panoiu</u><sup>4</sup>; <sup>1</sup>Department

of Physics, Shanghai Jiao Tong

Physical Electronics, School of

University (CN), <sup>2</sup>Department of

Electrical Engineering, Faculty of

Engineering, Tel Aviv University

(IL), <sup>3</sup>"Horia Hulubei" National

Institute for Physics and Nuclear

Engineering, Department of The-

ment of Electronic and Electrical

Engineering, University College

Anderson localization is a funda-

mental wave phenomenon occurring in various branches of phys-

ics. It was first predicted in solid

state physics, where P.W. Ander-

son had found that the interference from multiple scatterings of the electron by random defects changes the original infinitely extended Bloch eigenmodes into exponentially localized modes. The Anderson localization was later extended to photons, and the true Anderson localization of light has been observed in randomly distorted one- and twodimensional optical lattices. [6142]....Pg. 34

London (GB).

oretical Physics (RO), <sup>4</sup>Depart-

# Existence and stability of soliton-plasmon bound states <u>C. Milián</u><sup>1</sup>, D.E. Ceballos-

Herrera<sup>2</sup>, D.V. Skryabin<sup>1</sup>, A. Ferrando<sup>3</sup>; <sup>1</sup>University of Bath, Department of Physics (GB), <sup>2</sup>Universdad Autónoma de Nuevo León, Departmento de ciencias Físico Matemáticas (MX), <sup>3</sup>Universitat de València, Departament d'Òptica (ES). Soliton-plasmon bound states, soliplasmons, appear naturally as propagating eigenmodes of nonlinear Maxwell's equations for a metal/dielectric/Kerr interface. The theoretical treatment of the system predicts the properties of the stationary solutions and the dynamics, which are in good agreement with first principle numerical modeling. [6169] Pg. 32

## 11:35

#### Advances in submersible digital holography

<u>J. Watson</u>, N. Burns, School of Engineering, University of Aberdeen (GB).

In this paper, we describe some of the developments that have been made recently in submersible digital holography. We present some work on alternative geometries for recording of nontransparent targets and describe some of the results obtained on studies of plankton, bubbles, oil droplets and non-transparent targets. We will also report on the design and development of a new in-line configuration holocamera for deepsea deployment. [6092].....Pg. 36

#### 11:50

# Non-linear optimization for the reconstruction of wavefronts from gradient data

C. Falldorf, W. Li, C. von Kopylow, R.B. Bergmann, Bremer Institut für angewandte Strahltechnik (DE). We present an approach to reconstruct wavefronts from aradient data obtained from a shear interferometer or a Hartmann screen. It is based on an iterative non-linear optimization procedure which provides noise dependent weighting of the measured gradients. Numerical investigations prove the method to work. In the presented case, the recovered wave front is significantly improved compared to standard methods. [6101] Pa. 38

## TOM 1

12:05 STUDENT PRESENTATION Optical depth dependent dispersion compensation of a 'scan-free' time domain correlator for tomographic imaging J. Méteau, L. Froehly; Université de Franche-Comté, Institut FEMTO-ST, UMR CNRS 6174, Département d'Optique PM Duffieux (FR).

Optical depth dependent dispersion compensation is experimentally demonstrated by using a static diffraction grating in a scan free time domain optical coherence tomography system leading to a full depth axial resolution of 4 µm in air. [5840] Pg. 40

#### 12:20

#### Retinal ultrawidefield OCT imaging at 6.7 MHz using an FDML laser

T. Klein, W. Wieser, R. André, C. M. Eigenwillig, <u>R. Huber</u>; Lehrstuhl für BioMolekulare Optik, Fakultät für Physik, Ludwig-Maximilians-Universität München (DE).

We demonstrate multi-MHz OCT for ultrawide-field imaging in less than a second, using different 1050nm FDML lasers at a sweep rates of up to 3.35MHz. In one configuration the imaging speed is doubled by a two-spot setup to 6.7MHz. The trade off in image quality caused by the increase in speed is discussed. [5900]....Pg. 42

#### Room: Gordon B

#### TOM 3 12:05 Invited talk Enhanced linear and nonlinear light-matter interaction in slow light photonic crystal

waveguides. <u>I.F. Krauss</u>: SUPA, School of Physics & Astronomy, University of St Andrews, St Andrews (GB). Slow light photonic crystal waveguides offer the opportunity of enhancing both linear and the nonlinear optical effects; they uniquely combine resonant enhancement with sizeable bandwidth. We exemplify this opportunity by discussing progress in modulators, nonlinear devices and ultrafast tunable optical delay lines. [6167] Pg. 44

#### Room: Crombie A

#### TOM 4 12:05

#### 2D Optics on Bloch Surface Waves (BSWs) Based Platform: Polymer Lens and Prism

L. Ýu, V. Paeder, T. Sfez, E. Logean, <u>H.P. Herzig</u>, Optics &Photonics Technology Laboratory (OPT), École Polytechnique Fédérale de Lausanne (EPFL) (CH).

In this work, we use a novel platform concept based on Bloch Surface Waves (BSWs) and manipulate the BSWs propagation with two-dimensional (2D) dielectric patterns deposited on it. The concept opens a way to realize 2D integrated all-optics systems including sensing functionalities. [6155]....Pg. 46

#### 12:20

#### Dual Mode Indoor Optical Wireless Data Link Design using Micro-Optics For Robust Energy Efficient Operations

P.J. Marraccini<sup>1</sup>, <u>N.A. Riza<sup>1,2</sup></u>, <sup>1</sup>University College Cork, Dept. Electrical and Electronic Engineering (IE), <sup>2</sup>University College Cork, Tyndall National Institute (IE).

Presented is a microoptics-based novel design power smart dualmode optical transmitter that can operate simultaneously in the Line-of-Sight (LOS) mode and the Diffuse (DF) Mode or switch between the two modes. The power-data rate flexible design allows high data rates through the LOS mode along with robustness to blocking via DF mode. [5888].....Pg. 49

#### Room: Crombie B

#### TOM 5

12:05 STUDENT PRESENTATION Lasing from full polymer microcavity

G. Canazza<sup>1</sup>, M. Zavelani Rossi<sup>2</sup>, F. Scotognella<sup>2</sup>, G Lanzani<sup>3</sup>, D. Comoretto<sup>1</sup>, <sup>1</sup>Università di Genova, Dipartimento di Chimica e Chimica Industriale (IT), <sup>2</sup>Politecnico of Milano, Dipartimento di Fisica (IT), <sup>3</sup>Center for Nano Science and Technology (CNST), Istituto Italiano di Tecnologia (IIT) (IT). We present a full polymer microcavity, composed by distributed Bragg reflectors made of alternating layers of cellulose acetate and polyvinylcarbazole, with an organic active material (F8BT) inside. Upon optical pumping we find laser emission, with low threshold, demonstrating a full plastic organic device. [5969].....Pg. 51

Room: Gordon A
TOM 6

Toward low power plasmonsoliton in planar nonlinear structures

W. Walasik<sup>1,2</sup>, Y. Kartashov<sup>2</sup>, G. Renversez<sup>1</sup>; <sup>1</sup>Institut Fresnel, UMR CNRS, Université d'Aix-Marseille (FR), <sup>2</sup>ICFO, Universitat Politècnica de Catalunya (ES). We study the propagation of nonlinear waves in Kerr nonlinear dielectric/dielectric/metal planar structures. We develop both 1D and 2D nonlinear vector models to design realistic configurations supporting low peak power (≈ 1GW/cm²) plasmonsolitons. Suchstructures are compatible with current chalcogenide waveguide technology. [5895].....Pg. 55

#### Room 10 TOM 7

#### .

12:05 Comparison the techniques of finding a best focusing plane of particle image reconstructed from digital hologram V.V. Dyomin, D.V. Kamenev, Tomsk State University, Radiophysics Department (RU). To characterize the environments around the objects of the energy and production industries as well as to control some technological processes, various particles size, shape, location are to be measured, trajectory of particles movements (aerosols, plankton species, etc.) and their behavioral response should be controlled. So the particle coordinate precise measurement is very important. Comparison the techniques for the particle longitudinal coordinate measuring from digital hologram is presented. The coordinate evaluation is based on the finding the best focusing plane location of particle holographic image. Most precise methods are chosen by numerical calculation and experimentally. [5959].....Pg. 59

#### 12:20

Investigation of the operational stability of amplifying poly (9,9-dioctylfluorene) active waveguide operating in air <u>M. Anni</u>, Dipartimento di Matematica e Fisica "Ennio de Giorgi", Università del Salento (17). The Amplified Spontaneous Emis-

sion (ASE) intensity decrease during pumping is investigated in amplifying poly (9,9-dioctylfluorene) active

waveguide operating in air. The role of the active layer thickness and of the excitation density is discussed as well as the origin of the ASE quenching. [6052] Pg. 53

#### 12:20 Post deadline submission Observation of single and multiple vortex soliton states in vertical-cavity surface-emitting lasers with feedback

J. Jimenez, Y. Noblet, <u>I. Ackemann</u>; SUPA and Department of Physics, University of Strathclyde (GB). We observe the spontaneous formation of single and multiple vortex solitons in a self-focusing dissipative system, a broad-area vertical-cavity surface-emitting laser (VCSEL) with frequencyselective feedback by a volume Bragg grating. They are bistable and the transitions between different soliton structures are analyzed. [6436].....Pg. 57

#### 12:20 STUDENT PRESENTATION Comparative digital holographic microscope for wear detection at micro deep drawing tools S. Huferath-von Luepke, U. Zuch,

P. Huke, C. von Kopylow, R. B. Bergmann, Bremer Institut für angewandte Strahltechnik - BIAS GmbH (DE).

We developed a holographic microscope to record wear on micro deep drawing tools using comparative digital holography. This setup is suitable for restricted access to the tools within a micro deep drawing machine. [5925]....Pg. 61

#### TOM 1 14:00-16:00 OPTICAL COHERENCE

TOMOGRAPHY II Session Chair: J. de Boer, VU University (NL)

#### 14:00 Invited talk Microcirculation Imaging -

Where Next? M. Leahy, National University of Ireland, Galway (IE). Our hospitals are dominated by the use of non-light microscopy for imaging of tissues and the macrocirculation. In general these technologies serve a small percentage of the world's seven billion inhabitants very well, but even in well developed countries, this approach to medical imaging cannot serve the future needs of society. Meanwhile, living longer has exacerbated the challenges of diabetes and cancer, which have their origins and clinical manifestation in the microcirculation. Physics has delivered extraordinary advances in almost every facet of modern life. Photonics promises to bring healthcare to the next level, as it is the only means to see cells and molecules in small, accessible, low cost and safe imaging systems. Recently high resolution labelfree imaging of the microcirculation at clinically relevant depths and has become available in research labs. New imaging systems based e.g. on optical coherence tomography and photoacoustic microscopy take some hours to process 3D images of the microcirculation and often the images require significant 'touch-up'. [6290].....Pg. 63

#### 14:30

#### Assessment of retinal nerve fiber layer attenuation coefficients from OCT data

<u>K.A. Vermeer</u><sup>1A</sup>, J. van der Schoot<sup>1A,B</sup>, H.G. Lemij<sup>1B</sup>, J.F. de Boer<sup>1A,2</sup>; <sup>A</sup>Rotterdam Ophthalmic Institute, <sup>B</sup>Glaucoma Service, <sup>1</sup>Rotterdam Eye Hospital (NL), <sup>2</sup>VU University Amsterdam (NL). Recently, a method to derive the attenuation coefficient of the retinal nerve fiber layer from ophthalmic OCT images has been introduced, using the retinal pigment epithelium as a reference layer. We illustrate the strength of this method by showing that the attenuation coefficient is not affected by common OCT imaging artefacts. [6192].....Pg. 64

#### **Optical and Thermal** Characterization of Nanostructures by Photothermal Techniques R. Li Voti, G.L. Leahu,

M. Larciprete, C. Sibilia, M. Bertolotti; Dipartimento di Scienze di Base ed Applicate all'Ingegneria, Sapienza Università di Roma (IT).

Heat transport at nanoscale is of importance for many nanotechnology applications. The request to reduce the size of electronic devices and integrated micro/ nano-electro-mechanical systems provides the main driving force behind the scientific research and technological advancement in nanotechnology. It is now widely accepted that the thermal management in nanosize devices becomes fundamental as the size of the device reduces. Thermal conduction in nanostructures plays a critical role in controlling the performances and stability of nanodevices. [6023].....Pg. 70

#### Investigating reflow and wetting of non-circular nano-pillars to study nano-scale solid immersion lens fabrication

M.S. Kim<sup>1</sup>, G. Osowecki<sup>1</sup>, <u>T. Scharf</u>, E. Keeler<sup>2</sup>, S. Rydberg<sup>2</sup>; W. Nakagawa<sup>2</sup>, H.P.Herzig<sup>1</sup>, <sup>1</sup>Optics & Photonics Technology Laboratory, Ecole Polytechnique Fédérale de Lausanne (EPFL) (CH), <sup>2</sup>Electrical and Computer Engineering Department, Montana State University (US).

We investigate the reflow and wetting phenomena of noncircular, e.g., triangular and square, shaped nano-pillars of PMMA to fabricate nano-scale solid immersion lenses (SILs). Electron beam lithography (EBL) and thermal reflow are the core of the fabrication process. For the optical characterization at  $\lambda$ = 642 nm, nano-SILs are replicated on a transparent substrate by soft lithography. The focal spots produced by the nano-SILs show both spot-size reduction and peak-intensity enhancement, which are consistent with the immersion effect. [5996].....Pg. 71

#### 14.15

#### Optical tweezers assembly line for the micro-assembly of complex zeolite nanocontainer structures

M. Woerdemann<sup>1</sup>, M.Veiga-Gutiérrez<sup>2</sup>, Á. Barosso<sup>1</sup>, L. De Cola<sup>2</sup>, C. Denz<sup>1</sup>, <sup>1</sup>Institute of Applied Physics, <sup>2</sup>Physics Institute and Center for Nanotechnology (CeNTech), Westfälische Wilhelms-Universität Münster (DE). An optical tweezers assembly line is presented that combines the versatile optical micromanipulation capabilities of holographic optical tweezers with a microfluidic plat-form in order to construct complex 2D and 3D assemblies of nanocontainers as e.g. zeolite L with photonic functionalities. served Bose-Einstein condensation of a two-dimensional photon gas in an optical microcavity. Here, the transversal motional degrees of freedom of the photons are thermally coupled to the cavity environment by multiple absorption-fluorescence cycles in a dye medium, with the latter serving both as a heat bath and a particle reservoir. Due to particle exchange between the photon gas and the dye molecules, grandcanonical experimental conditions are expected to be realized in this system. Under these conditions, a regime with strong fluctuations of the condensate number (fluctuation catastrophe) is theoretically expected. that is not observed in present atomic BEC experiments. I will give an update on our theoretical and experimental work. [6110]....Pg. 75

#### Control of laser characteristics in small-molecule organic dielectric microcavities

M. Sudzius, R. Brückner, M. Langner, C. Reinhardt, S.I. Hintschich, V.G. Lyssenko, H. Fröb, K. Leo, Institut für Angewandte Photophysik, Technische Universität Dresden (DE).

We report on the control of the spatial, temporal, and spectral characteristics of low threshold room-temperature organic dielectric microcavity lasers. A major impact on their emission properties is achieved by mechanical (fixed) or optical (dynamic) patterning of the organic cavity layer, made of Alq3:DCM. [6012].....Pg. 77

14:45 Investigation of human cone outer segment renewal using SLO/OCT <u>M. Pircher</u> <sup>1</sup> , JS. Kroisamer <sup>2</sup> , F. Felberer <sup>1</sup> , U. Schmidt-Erfurth <sup>2</sup> , C.K. Hitzenberger; <sup>1</sup> Center for Medical Physics and Biomedical Engineering, Medical University Vienna (AT); <sup>2</sup> Department of Ophthalmology, Medical Univer- sity Vienna (AT). The aim of this study was to investigate the ability of SLO/ OCT to detect temporal changes of cone photoreceptors caused by outer segment renewal. Measurements on healthy volun- teers showed changes in the cone outer segment lengths as well as changes in the backscattered intensity from the junction be- tween inner and outer segments (IS/OS) and end tips of cone photoreceptors (ETPR). Moreover cracks or defects within the packing arrangement of the outer segment discs give rise to an OCT signal that can be tracked over time and can be used to estimate the renewal rate. [6180]Pg. 88		14:45 Magnetic response of silicon nanoparticles in the visible spec- tral range <u>A.I. Kuznetsov</u> <sup>1</sup> , A.E. Miroshnichenko <sup>2</sup> , Y.H. Fu <sup>1</sup> , B. Luk'yanchuk <sup>1</sup> ; <sup>1</sup> Data Storage Institute (SG), <sup>2</sup> Nonlinear Physics Centre, CUDOS, Australian Na- tional University (AU). We experimentally demonstrate that silicon nanoparticles of dif- ferent shapes and sizes exhibit strong magnetic dipole response in optical range, which can be continuously tuned throughout the whole visible spectra. It opens up new perspectives for fabrication of low-loss optical metamateri- als. [5901]Pg. 92	14:30 Holographic manipulation of absorbing particles in air using arrays of optical bottle beams <i>C. Alpmann, M. Esseling, P. Ross</i> <i>C. Denz, Institut für Angewanth</i> <i>Physik and Center for Nonlinea</i> <i>Science (CeNoS), Westfälische</i> <i>Wilhelms-Universität Münster</i> <i>(DE).</i> The combination of established techniques of holographic optic trapping with hollow intensity distributions in order to manipu- late absorbing particles allows for the dynamic manipulation of absorbing particles along arbi- trary paths. Its versatility is dem onstrated by the simultaneous and dynamic trapping of multi- ple particles. [5939]Pg. 96

Martin<sup>1</sup>, <sup>1</sup>Institut de Planétologie et d'Astrophysique de Grenoble (IPAG) (FR), <sup>2</sup>FEMTO-ST, Université de Franche-Comté (FR). We present theoretical and experimental results on photonic crystals on LiNbO3 waveguides and junctions developed for midinfrared interferometry, showing that is possible to achieve high optical delays in micrometric devices, with low modulation

voltages, due to group velocity reduction. [5894].....Pg. 117

#### 15:30 Smart Nanoplasmonics for

Invited talk

Chemistry and Biology L. Na Liu; Department of Electrical & Computer Engineering, Rice University (US). In this talk, I will present how to utilize smart nanoplasmonics for answering catalytic chemistry questions and constructing 3D nanostructures that exhibit intriguing plasmonic chirality. I will first demonstrate antennaenhanced hydrogen sensing at the single-particle level<sup>1</sup>. We place a single palladium nanoparticle near the tip region of a gold nanoantenna and detect the changing optical properties of the system upon hydrogen exposure. Antennaenhanced single-particle sensing pushes the sensitivity of plasmonic gas sensors to an ultimate limit and opens up myriad possibilities for detecting optically inactive species in a controlled fashion. The sinale-particle sensing strategy will have profound significance for the optical observation of chemical reactions and catalytic activities on a single platform in nanoreactors, and has the potential to be extended to biochemical systems in the future. Moreover, antenna-

enhanced sensing comprises a noninvasive and generalizable scheme that is applicable to a variety of physical and biochemical materials. [6284]

Fluorescent source detection in disordered media

<u>N. Irishina</u><sup>1</sup>, M. Moscoso<sup>1</sup>, R.Carminat<sup>12</sup>, <sup>1</sup>Instituto Gregorio Millán, Universidad Carlos III de Madrid (ES), <sup>2</sup>Institut Langevin, ESPCI ParisTech, CNRS (FR). We show that the position of a fluorescent source in disordered media can be retrieved from its fluorescence lifetime and priory information about the scatterers positions. Numerical experiments in 2D show that the ill-posedness of the problem is reduced when the level of scattering is increased. [5805]....Pg. 159

#### Room: Crombie A

#### TOM 4 17:00 Invited talk Modal method in nanophotonics <u>P. Lalanne;</u>

Institut d'Optique (FR). Many micro-nanophotonic devices that are exploiting strong field confinements are fundamentally related to modes of translational invariant or of periodic waveguides.

After a rapid overview of the Modal Method for classical zinvariant and periodic waveguides that we use in our calculation, we will try to illustrate how important are mode concepts for designing or understanding nanophotonic devices, such as the role of plasmon in the extraordinary optical transmission, the analysis of slow-light transport in real photonic crystal waveguides (with fabrication imperfection). [6289]....Pg. 163

17:15 STUDENT PRESENTATION Light emission statistics in correlated random photonic nanostructures <u>N. de Sousa</u><sup>1</sup>, J.J. Saenz<sup>1</sup>,

A. García-Martín<sup>2</sup>, L.S. Froufe-Pérez<sup>3</sup>; <sup>1</sup>Departamento de Física de la Materia Condensada, Universidad Autónoma de Madrid (ES), <sup>2</sup>Instituto de Microelectrónica de Madrid, CSIC (ES), <sup>3</sup>Instituto de Estructura de la Materia, CSIC (ES). The statistical properties of light transport and emission in disordered media has been a matter of intense research during the last century. Being the basis of coherent multiple scattering of waves well known, the phenomenon itself is not yet fully explored and understood. These multiple wave scattering effects are at the heart of emerging behaviors like Anderson localization of light and electrons, band structure in crystalline solids or photonic crystals (PhC), among many others. [6171].....Pg. 161

Vortex induced complex dynamics of optical patterns N. Marsal, V. Caullet, D. Wolf-

ersberger, M. Sciamanna; Supélec, OPTEL Research Group, Laboratoire Matériaux Optiques, Photonique et Systèmes (LMOPS - EA4423) (FR). We prove numerically and experimentally that optical pattern formation can arise by using counterpropagating vortices. Such a beam carrying an orbital angular momentum is injected into a photorefractive single feedback system. We show that the nonlinear wave-mixing occurring inside the medium gives rise to different complex patterns with peculiar phase singularities and rotating dynamics. We demonstrate that the dynamics is induced by the vortex angular momentum and the rotation velocity depends on the vortex topological charge. [6003] Pg. 166

#### 17:15 STUDENT PRESENTATION Nonlocal feedback with input vortices

V. Caullet, N. Marsal, M. Sciamanna, D. Wolfersberger: Supélec, OPTEL Research Group, Laboratoire Matériaux Optiques, Photonique et Systèmes (LMOPS – EA4423) (FR). We study experimentally a photorefractive single feedback system when the mirror is voluntary misaligned (nonlocal feedback) and an optical vortex is used as the pump beam. We show that different geometries can coexist in the resulting pattern and that the drifting and rotating dynamics can annihilate each other. [6173].....Pg. 168

harlal Nehru Centre for Advanced Scientific Research (IN). Advances in organic electronics based devices pave a route to access and monitor biological sensory processes. We emphasise the role of organic electronics in developing devices with implications in vision related ailments and artificial retina components. Semiconducting polymer device structures can operate as photoreceptor-type sensors in aqueous environment, and can be used as stimulation elements upon interfacing with other retinal neurons like the ganglion cells. We recently demonstrated a singlepixel, single-layer structure (instead of multiple-layer stacks) with an active layer consisting of bulk heterojuction polymers, which is capable of distinguishing multiple colors without an external bias. The methodology essentially relied on in wavelength-specific, displacement-current transient characteristics and polarity of the response upon photoexcitation. We discuss other recent developments from our laboratory in this direction. [6216].....Pg. 222

#### Rationalizing Phase Transitions with Thermal Annealing Temperatures for P3HT:PCBM

**Organic Photovoltaic Devices** A.J. Pearson<sup>1</sup>, P.E. Hopkinson<sup>2</sup>, T. Wang<sup>1</sup>, A.M. Donald<sup>2</sup>, D.G. Lidzey<sup>1</sup>, <sup>1</sup>Department of Physics, University of Sheffield (GB), <sup>2</sup>Department of Physics, University of Cambridge (GB). We have studied a range of organic photovoltaic devices (OPVs) based on a thin-film blend of P3HT and PCBM. Comparing device studies with a characterization of the thermal transitions of the blend, we can provide a mechanistic description of the optimum annealing temperatures necessary to improve the operational efficiency of a device. For as-cast P3HT:PCBM blend thin-films we evidence two glass transition temperatures, tentatively corresponding to the existence of two compositionally different amorphous states. We demonstrate that an improvement in device efficiency only occurs once the film has been heated above the upper apparent alass transition temperature of the blend. If annealing is performed above the optimum temperature, excessive phaseseparation and a partial reduction in film optical density leads to a general decrease in device efficiency. Both of these characteristic temperatures are dependent upon the composition of the blend. [5870].....Pg. 251

#### Disaster Prevention by Photonics - Toward Realization of Safe and Secure Society

<u>Y. Tanaka</u>, T. Kurokawa; Tokyo University of Agriculture and Technology (JP).

The Great Earthquake and Tsunami that hit Japan on March 11, 2011 caused about 20,000 dead and missing people, and also caused Japan 's worst nuclear accident at Fukushima Daiichi. Now is the time for creating the ultimate technology that really contributes to avoid the tragedy to happen again. This is "the disaster prevention photonics", whose recent development in Japan will be introduced. The goal of the disaster prevention photonics is to develop and fuse the technologies of

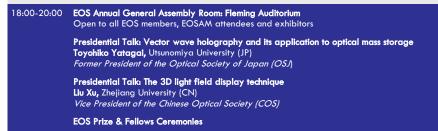

- highly-sensitive optical sensors for environmental monitoring, including climate change and diastrophism that might lead to disaster,
- · photonic devices that work even under adverse conditions such as radiation environment, and
- photonic network that really functions at the time of disaster. [6281].....Pg. 291

#### 16:45-17:30 PLENARY TALK

#### Graphene for Photonics and Optoelectronics

A. Ferrari, University of Cambridge (GB).

The richness of optical and electronic properties of graphene attracts enormous interest. So far, the main focus has been on fundamental physics and electronic devices. However, it has also great potential in photonics and optoelectronics, where the combination of its unique optical and electronic properties can be fully exploited, the absence of a bandgap can be beneficial, and the linear dispersion of the Dirac electrons enables ultra-wide-band tunability. The rise of graphene in photonics and optoelectronics is shown by several recent results, ranging from solar cells and light emitting devices, to touch screens, photodetectors and ultrafast lasers. 	TOM 6 09:00-10:30 OPTICAL SOLITONS Session Chair: A. Szameit, Friedrich Schiller University Jena (DE) 09:00 Spontaneous spatial fractal patterns in simple linear and nonlinear optical cavities G.S. McDonald', J.M. Christian', J.G. Huang <sup>2</sup> , T.M. Walsh', C. Bostock'; <sup>1</sup> University of Salford, Materials & Physics Research Centre (GB), <sup>2</sup> University of Gla- morgan, Faculty of Advanced Technology (GB). We present an overview of our research on the fractal- generating properties of two distinct optical cavities: fractal eigenmodes of linear systems with inherent magnification, and spontaneous spatial fractals in nonlinear systems. Our latest research focuses on "kaleidoscope" lasers and nonlinear ring-resonator geome- tries. [5821]Pg. 304 09:15 STUDENT PRESENTATION Frequency-controlled soliton steering in nematic liquid crystals A. Piccardi <sup>1</sup> , A. Alberucci <sup>1</sup> , O. Buchnev <sup>2</sup> , M. Kaczmarek <sup>2</sup> , I.C. Khoo <sup>3</sup> ; G. Assanto <sup>1</sup> ; <sup>1</sup> Univer-

and Astronomy (GB), <sup>3</sup>Pennsylvania State University (US). We exploit the electro-optic response of a dual frequency

nematic liquid crystal to obtain large steering of nonlinearly self -confined beams, i.e. nematicons, by means of the applied bias frequency. Patterned electrodes ensure the reorientation of the liquid crystal director and the corresponding change in walkoff. [5958]....Pg. 306 NOTES

#### TOM 1

09:30 Invited talk Novel tumour vaccination strategies in spontaneously occurring animal models

<u>H. Murua Escobar</u>, University of Veterinary Medicine Hannover (DE).

Vaccination of nucleic acid constructs or functionalised cells are key technologies in the development of gene therapeutic approaches. Several different kinds of conventional strategies have been developed to deliver these target molecules into the respective cells types. These strategies can be roughly subdivided in chemical (e.g. liposomes, calcium phosphate, transfection reagents), physical (e.g. electroporation, micro injection, particle auns), and viral mediated approaches. While several of these techniques work fine in vitro the achieved efficiencies in vivo are -with some exceptions- unsatisfying or bare considerable risks. Recently, novel techniques and agents as opto-/photoporation and nanoparticles have been introduced offering an alternative and multiple possibilities to enhance the current strategies. [6446].....Pg. 310

#### 10:00

Fast cell-selective optogenetic modification of primary neurons using femtosecond optical transfection

<u>M. Antkowiak</u><sup>1</sup>, K. Dholakia<sup>2</sup>, F. Gunn-Moore<sup>1</sup>; <sup>1</sup>SULSA, University of St Andrews, School of Biology (GB), <sup>2</sup>SUPA, University of St Andrews, School of Physics & Astronomy (GB).

We demonstrate optogenetic modification of selected primary cortical neurons using femtosecond laser mediated optical transfection. We enhance further the functionality of this technique by using fast three-dimensional laser beam steering and shaping enabling a "point-and-shoot" user-friendly modification of neural circuits. [6125]....Pg. 311

# Room: Fleming Auditorium TOM 2 09:30 Invited talk

Plasmonic filters for Digital Imaging D.R.S. Cumming<sup>1</sup>, Q. Chen<sup>1</sup>,

5. Collins<sup>2</sup>, D. Chitnis<sup>2</sup>; <sup>1</sup>University of Glasgow, School of Engineering (GB), <sup>2</sup>University of Oxford, Department of Engineering (GB). The ability to control optical filter functions using surface plasmon polaritons makes it possible to eliminate traditional dye-doped polymer filters for digital imaging focal plane arrays. In this presentation we describe the design and implementation of new colour imaging technologies. [6107].....Pg. 313

# Room: Gordon B

#### 09:30 Giant optical nonlinearity with

few incident photons on a quantum dot-micropillar device V. Loo<sup>1,2</sup>, <u>C. Arnold</u><sup>1</sup>, A. Dousse<sup>1</sup>,

A. Lemaître<sup>1</sup>, I. Sagnes<sup>1</sup>, O. Krebs<sup>1</sup>, P. Voisin<sup>1</sup>, P. Senellart<sup>1</sup>, L. Lanco<sup>1,2</sup>; <sup>1</sup>Lab. de Photonique et de Nanostructures, CNRS (FR), <sup>2</sup>Université Paris Diderot - Paris 7, Dép. de Physique (FR). Giant optical nonlinearity is observed both under continuouswave and pulsed excitation in a quantum dot-micropillar device. A record nonlinearity threshold of only 8 incident photons per pulse is demonstrated, paving the way for the realization of all-optical switches triggered by single photon pulses. [5911].....Pg. 317

#### 09:45 Post deadline submission Plasmonic crystals for improving the performance of highly efficient sources

<u>G. Lozano</u><sup>1</sup>, S.R.K. Rodríguez<sup>1</sup>, M.A. Verschuren<sup>2</sup>, J. Gómez-Rivas<sup>1,3</sup>; <sup>1</sup> Center for Nanophotonics, FOM Institute AMOLF, c/o Philips Research Lab. (NL); <sup>2</sup>Philips Research Laboratories (NL), <sup>3</sup>COBRA Research Institute, Eindhoven University of Technology (NL).

It is generally believed that plasmonic structures only provide benefits for light emission when used with low quantum efficiency (QE) emitters. Herein we demonstrate a very large emission increase (up to 60-fold for unpolarized emission in defined directions) using emitters developed for SSL applications with an intrinsic QE close to one. [6422] Pg. 319 10:00

#### Surface plasmon polariton amplification upon electrical injection: towards deep-subwavelength active plasmonic devices

D.Yu. Fedyanin<sup>1</sup>, <u>A.V. Krasavin</u><sup>2</sup>, A.V. Arsenin<sup>1</sup>, A.V. Zayats<sup>2</sup>; <sup>1</sup>Moscow Institute of Physics and Technology (State University), Lab. of Nanooptics and Femtosecond Electronics, Dep. of General Physics (RU), <sup>2</sup>King's College London, Nano-optics and Nearfield Spectroscopy Group, Dep. of Physics (GB).

We present a novel scheme of surface plasmon polariton (SPP) amplification upon electrical injection that gives a possibility to integrate pumping and plasmonic waveguides and cavities on the same chip. This opens the prospects for realization of compact on-chip optical interconnects, nanoscale coherent SPP and light sources, detectors and modulators. [6147].....Pg. 321

#### Development of large diameter elliptical graded nanostructured microlens

<u>R. Buczynski</u><sup>1,2</sup>, A.J. Waddie<sup>1</sup>, J. Nowosielski<sup>1,3</sup>, A. Filipkowski<sup>1,2</sup>, D. Pysz<sup>2</sup>, R. Stepien<sup>1</sup>, M.R. Taghizadeh<sup>1</sup>; <sup>1</sup>Heriot-Watt University, School of Engineering and Physical Sciences (GB), <sup>2</sup>Institute of Electronic Materials Technology, Dept. of Glass, (PL), <sup>3</sup>University of Warsaw, Faculty of Physics, (PL). In this paper, we demonstrate the

feasibility of using the nanostructured micro-optics technology to create a large diameter quantised elliptical microlens with internal structure feature sizes much smaller than the wavelength of the incident light. [6177]....Pg. 323

#### 09:45

#### Broadband Nanostructured Form Birefringent Material

A.J. Waddie<sup>1</sup>, A. Filipkowski<sup>1</sup>, J. Nowosielski<sup>1</sup>, R. Buczynski<sup>2</sup>, M.R. Taghizadeh<sup>1</sup>, <sup>1</sup>Institute of Photonic and Quantum Sciences, School of Engineering and Physical Science, Heriot-Watt University (GB), <sup>2</sup>Institute of Electronics Materials Technology (ITME) (PL). The nanostructured micro-optics fabrication technology, which exploits the techniques used in the fabrication of photonic crystal fibre, can be used to create a wide range of optical components. In this paper, we demonstrate the applicability of the method to the creation of a form birefringent material with customised material parameters and verify that the manufactured components are capable of providing flat birefringence over a significant wavelength range. [6111].....Pg. 325

#### 10:00 STUDENT PRESENTATION Simulation of the wave propagation behind a sub-wavelength metal axicon polarizer generating radial polarization

<u>W. Iff</u>, N. Lindlein; University of Erlangen, Chair of Optics and Erlangen Graduate School in Advanced Optical Technologies (SAOT) (DE).

The propagation of timeharmonic vectorial wave modes requires the simulation of two components of the electric field. Here, a method combining ray tracing and vectorial free space propagation using the angular spectrum of plane waves is used for the special case of light behind an element generating radial polarization. [6140]....Pg. 327

10:00

#### Design, realization, and characterization of a silicon photonics coherent mixer for PDM-QPSK optical communications

R. Orobtchouk<sup>1</sup>, P. Labeye<sup>2</sup>, X. Hu<sup>1</sup>, S. Malhouitre<sup>2</sup>, P. Grosse<sup>2</sup>, J.-M. Fedeli<sup>2</sup>; <sup>1</sup>Institut des Nanotechnologies de Lyon (INL), CNRS UMR5270, Université de Lyon, INSA-Lyon, Bât "Blaise Pascal" (FR), <sup>2</sup>CEA-LETI, Minatec, CEA-Grenoble (FR). Integration of optical routing basic building blocks of a DQPSK receiver is demonstrated in CMOS silicon-on-insulator (SOI) technology. Experimental results show a maximum deviation of the phase shift of  $\pm 2.3^{\circ}$ and an imbalance between the 4 outputs lower than 10%. [5931] Pg. 315

#### Room: Crombie B

#### TOM 5

09:30 STUDENT PRESENTATION Survey of metal oxides for use in organic electronic devices J. Griffin, A.R. Buckley, University of Sheffield, Department of Physics and Astronomy (GB). A combination of ultraviolet photoelectron spectroscopy (UPS), X-ray photoelectron spectroscopy (XPS) and absorption spectroscopy have been used to characterise metal oxides. These metal oxides have then been placed within organic electronic devices to compare performance as charge buffer layers. [6178] Pg. 329

#### 09:45 STUDENT PRESENTATION Efficient energy transfer between a GaN thin film and polyfluorene

R. Jayaprakash<sup>1,2</sup>, P. Corfdir<sup>3</sup>, B. Deveaud<sup>3</sup>, E. Monroy<sup>4</sup>, M. Kaliva<sup>1</sup>, G. Stavrinidis<sup>2</sup>, N.T. Pelekanos<sup>1,2</sup>; <sup>1</sup>Materials Science and Technology Department, University of Crete (GR); <sup>2</sup>Microelectronics Research Group, IESL-FORTH (GR); <sup>3</sup>Institut de Photonique et d'Electronique Quantiques, Ecole Polytechnique (CH), 4CEA-CNRS Group of Nanophysics and Semiconductors, CEA/INAC/SP2M (FR). Förster Resonance Energy Transfer (FRET) has been observed, between a thin film of GaN and polyfluorene, at remarkable efficiencies of 73% for free GaN A-excitons, despite the absence of carrier confinement at the surface. [5881].....Pg. 331

#### 10:00

#### n-Type Semiconducting Polymer Fibers for Flexible Electronics

E.V. Canesi<sup>1</sup>, A. Luzio<sup>1</sup>, A. Bianco<sup>2,3</sup>, M. Caironi<sup>1</sup>, <u>C. Bertarelli</u><sup>1,3</sup>; <sup>1</sup>Center for Nano Science and Technology@PoliMi, Istituto Italiano di Tecnologia (IT), <sup>2</sup>INAF – Osservatorio Astronomico di Brera (IT), <sup>3</sup>Dipartimento di Chimica, Materiali ed Ingegneria Chimica (IT).

Electrospun fibers of poly{[N,Nbis(2-octyl-dodecyl)-naphthalene -1,4,5,8-bis(dicarboximide)-2,6diyl]-alt-5,5-(2,2-bithiophene)} (P(NDI2OD-T2)) are tested in bottom-contact bottom gate transistors showing high performance. [6061].....Pg. 333

Ramírez,</i> <i>L.E Bausár, Departamento Física</i> <i>de Materiales, Universidad</i> <i>Autónoma de Madrid (ES).</i> Square lattices of inverted do- mains ranging from 1 to 20 μm have been obtained in Yb <sup>3+</sup> :LiNbO3. Confocal μ-Raman, μ-Fluorescence and Second Har- monic Generation (SHG) were employed to characterize the patterns. Spectroscopic images of domains and domain walls and tunable Cerenkov type SHG are demonstrated. [5937] Pg. 374

### 15:15 STUDENT PRESENTATION Multifractal analysis of laser Doppler flowmetry and bloimpedancemetry signals for an integrated analysis of the cardiovascular system

<u>E. Guerreschi<sup>1,2</sup></u>, A. Humeau-Heurtier<sup>2</sup>, S. Bricq<sup>1,2</sup>, G. Mahe<sup>3</sup>, G. Leftheriotis<sup>3</sup>; <sup>1</sup>LUNAM Université, Groupe Esaip (FR), <sup>2</sup>LUNAM Université, Laboratoire d'Ingénierie des Systèmes Automatisés (LISA), Université d'Angers (FR), <sup>3</sup>LUNAM Université, Laboratoire de Physiologie et d'Explorations Vasculaires, UMR CNRS 6214-INSERM U1083, Centre Hospitalier Universitaire d'Angers (FR). Laser Doppler flowmetry signals (from the peripheral cardiovascular system, CVS) associated with bio-impedance signals (from the central CVS) are processed via multifractal analyses in order to provide an integrated study of the CVS. Situations at rest and after a vasodilator administration (glycerin trinitrate) are studied. [6086].....Pg. 365

### 15:15 Purcell Factor of Plasmonic Nanoantennas

<u>C. Sauvan<sup>1</sup></u>, J.P. Hugonin<sup>2</sup>, P. Lalanne<sup>1</sup>; <sup>1</sup>Laboratoire Photonique Numérique et Nanosciences, Université Bordeaux 1, Institut d'Optique, CNRS (FR),<sup>2</sup>Laboratoire Charles Fabry, Institut d'Optique, CNRS, Université Paris-Sud (FR). The Purcell factor  $(3Q\lambda^3/4\pi^2V)$ is a widely used figure of merit for spontaneous emission in optical cavities. However, in dissipative systems such as plasmonic nanoantennas, the Local Density of Optical States (LDOS) cannot be described with the standard Purcell factor expression. We generalize the definition of the mode volume V to dissipative systems, for which losses can be due to absorption and/or radiation, and we apply the generalized formalism to single and coupled nanoantennas. We discuss the physical mechanisms responsible for the appearance of Fano resonances in the LDOS of coupled resonators. [5992] Pg. 372

### 15:15 STUDENT PRESENTATION Creation of multiperiodic and defect photonic structures using optical multiplexing techniques <u>M. Boguslawski</u>, A. Kelberer, P. Rose, C. Denz; Institut für Angewandte Physik and Center for Nonlinear Science (CeNoS), Westfällsche Wilhelms-Universität Münster (DE). In this contribution we suggest an elaborate method to optically induce multiperiodic structures by

implementing an intuitive holographic multiplexing technique. This technique is further applied to induce photonic lattices revealing local defects. [5956] Pg. 376

Ge on Si Photonics Platform for **Photonic Integrated Circuits** D.J. Paul, M. Sorel, P. Velha, M. Strain, K. Gallacher, A. Samarelli, D. Dumas; University of Glasgow, School of Engineering (GB). To move Si photonics from the laboratory to functional applications, process modules that can be integrated into complete systems are required. We demonstrate LEDs, photodetectors, waveguides, tunable filters, coupled resonators and aratinas on Si potentially allowing applica-

tions in healthcare, telecoms,

sensing and security markets.

[6161].....Pg. 465

### 18:30 **STUDENT PRESENTATION** High responsivity photodetectors in evaporated Ge-on-Si

<u>V. Sorianello</u>, M. Paglia, L. Colace, G. Assanto; University "Roma Tre", Nonlinear Optics and OptoElectronics Lab (NooEL) (IT).

Germanium on Silicon has become a well-established technology for the fabrication of high performance near-infrared photodetectors for Silicon photonics. We present Ge-on-Si photodetectors grown by thermal evaporation, comparable in performance with *p-i-n* detectors prepared by CVD. [6005] Pg. 467

### STUDENT PR Observation of Waveguiding-Mie Scattering Interference at GaAs Nanowires by Second G. Brönstrup<sup>1</sup>, R. Grange<sup>2</sup>, A. Sergeyev<sup>2</sup>, M. Kiometzis<sup>1</sup>, S. Christiansen<sup>1</sup>, J. Richter<sup>2</sup>, T. Pertsch<sup>2</sup>, A. Tünnermann<sup>2,3</sup>, C. Leiterer<sup>4</sup>, W. Fritzsche<sup>4</sup>, C. Gutsche<sup>5</sup>, A. Lysov<sup>5</sup>, W. Prost<sup>5</sup>, F.-J. Tegude<sup>5</sup>; <sup>1</sup>Max Planck Institute for the Science of Light (DE), <sup>2</sup>Friedrich-Schiller-Universität Jena, Institute of Applied Physics, Abbe Center of Photonics (DE), <sup>3</sup>Fraunhofer Institute of Applied **Optics and Precision Engineering** (DE), 4 Institute of Photonic Technology, Nanobiophotonics (DE), <sup>5</sup>University of Duisburg-Essen, Solid State Electronics Department and CeNIDE (DE). We show that second harmonic generation (SHG) in GaAs nanowires (NWs) can experimentally be used to display in an optical microscope the electrical field distribution at their surfaces. We demonstrate and visualize the interference of a guided wave with Mie scattered light which is supported by a completely analytical model. [6037].....Pg. 469

### 18:15

### Deep-subwavelength imaging of the modal dispersion of light

<u>R. Sapienza<sup>1,2</sup>, J. Renger<sup>2</sup>,</u> M. Kuttge<sup>2</sup>, N.F. van Hulst<sup>2,3</sup>, T. Coenen<sup>4</sup>, A. Polman<sup>4</sup>; <sup>1</sup>Department of Physics, King's College London (GB), 2ICFO-Institut de Ciencies Fotoniques(ES), 3/CREA-Institució Catalana de Recerca i Estudis Avancats (ES), <sup>4</sup>Center for Nanophotonics, FOM Institute for Atomic and Molecular Physics (AMOLF) (NL). Numerous optical devices and technologies such as lasers, lightemitting diodes, and quantum optical devices rely on the controlled coupling of a local point emitter to its photonic environment, which is governed by the local density of optical states (LDOS). This coupling, either to the far field or to well-defined optical modes, is maximized when the source is placed at a position where the local density of optical states (LDOS) is highest. Key demonstrations of this effect are e.g. the enhanced spontaneous emission of quantum dots in the field maximum of a photonic crystal cavity or the directional emission in the proximity of a metallic nanoantenna. [5807].....Pg. 471

### Room: Crombie B

### TOM 5

18:00 STUDENT PRESENTATION Strong coupling in an organic polariton light emitting diode N. Christogiannis, D.M. Coles, D.G. Lidzey; The University of Sheffield, Department of Physics and Astronomy (GB). We present the fabrication of a strongly coupled organic LED microcavity containing a Jaggregated layer of a TDBC dye that acts as both the electron-hole recombination layer and the strongly coupled medium. We characterise the angular-dependent and integrated external electroluminescence emission from the cavities and discuss fundamental mechanisms at play. [5928].....Pg. 472

18:15 STUDENT PRESENTATION Energy transfer in weakly coupled hybrid nanostructures: plasmonic effects <u>S. Kawka</u>, G.C. La Rocca; Scuola Normale Superiore (IT). We study theoretically the plas-

monic enhancement of the resonant energy transfer from a Wannier exciton in a quantum well to a Frenkel exciton of a molecular crystal overlayer. [5994]....Pg. 474

### Room: Gordon A

### TOM 6 18:00

Nonparaxial refraction laws in optics: from non-Kerr interfaces to waveguide arrays

<u>J.M. Christian</u><sup>1</sup>, G.S. McDonald<sup>1</sup>, E.A. McCoy<sup>1</sup>, J. Sánchez-Curto<sup>2</sup>, P. Chamorro-Posada<sup>2</sup>; <sup>1</sup>University of Salford, Materials & Physics Research Centre (GB), <sup>2</sup>Universidad de Valladolid, ETSI Telecomunicación (ES). Angular effects play a central role in essentially all non-trivial optical configurations, and can be well-described within a Helmholtz-type nonparaxial framework. We report recent results modelling spatial solitons interacting with cubic-quintic material interfaces, and extend related considerations to periodicallypatterned optical media. [5820] Pg. 478

### 18:15 STUDENT PRESENTATION Airy beam induced optical waveguide router

### P. Rose, F. Diebel,

<u>M. Boguslawski</u>, C. Denz; Institut für Angewandte Physik and Center for Nonlinear Science (CeNoS), Westfälische Wilhelms-Universität Münster (DE). We present a new all-optical routing scheme based on the Airy beam family. The demonstrated router has individually addressable output channels and can be used as optically induced splitter with configurable outputs as well. [5941]....Pg. 480

### 18:30 **STUDENT PRESENTATION** High efficiency and low power consumption Driver for AMOLED display with compensation

<u>S.Saad</u><sup>1</sup>, L. Hassine<sup>2</sup>; <sup>1</sup>Group of Electronics and Quantum Physics. Faculty of Sciences of Tunis (TN), <sup>2</sup>National Institute of Applied Sciences and Technology (TN). A new proposed compensation driver pixel circuit is developed for an active-matrix organic light-emitting-diode (AMOLED) display and their efficiency is verified in compared with the conventional configuration with 2 TFTs. This circuit based on OLED and on poly-crystalline silicon thin-film transistor (poly-Si TFTs). [6156].....Pg. 476

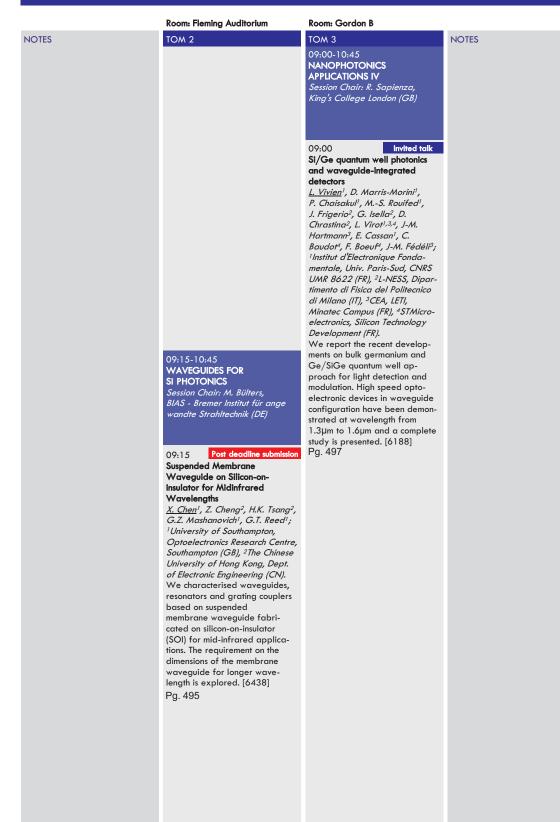

### 18:30 **STUDENT PRESENTATION** Achromatic and reconfigurable adiabatic light transfer in photoinduced waveguides

<u>C. Ciret</u><sup>1</sup>, V. Coda<sup>1</sup>, A.A. Rangelov<sup>2</sup>, D.N. Neshev<sup>3</sup>, G. Montemezzani<sup>1</sup>; <sup>1</sup>Laboratoire Matériaux Optiques, Photoniques et Systèmes (LMOPS), Université de Lorraine and Supélec (FR), <sup>2</sup>Department of Physics, Sofia University (GB), <sup>3</sup>Nonlinear Physics Center, Australian National Univ. (AU).

Adiabatic light transfer over multiple states is verified experimentally using properly designed reconfigurable photoinduced waveguide array structures. The robustness of the process is demonstrated by varying the number of waveguides in the array as well as the probe wavelength. [6044].....Pg. 482

	Room: Fleming Auditorium	Room: Gordon B	
DTES	18:45 <b>Ge/Si Single Photon Avalanche</b> <b>Diodes</b> <u>N.J. Pilarim</u> <sup>1</sup> , H. Rafferty <sup>1</sup> , L.J.M. Lever <sup>1</sup> , Z. Ikonic <sup>1</sup> , R.W. 09:30 STUDENT PRESENTATION Hot-Wire Chemical Vapour Deposition for Integrated Silicon Waveguide Devices

<u>I. Ben Masaud</u><sup>1</sup>, A. Tarazona Labrador<sup>1,2</sup>, G. Mashanovich<sup>1</sup>, G.T. Reed<sup>1</sup>, H.M.H. Chong<sup>1</sup>; <sup>1</sup>University of Southampton, Nano Research Group, Electronics & Computer Science, Faculty of Physical & Applied Sciences (GB), <sup>2</sup>Echerkon Technology Limited (GB).

We have investigated a low cost hot-wire chemical vapour deposition technique to produce high quality thin film silicon epitaxial layer for waveguide device applications. Raman shift results show that silicon crystal grain size deposited on insulators can be controlled with process optimisation. [6145]....Pg. 509

### 09:45 **STUDENT PRESENTATION** Silicon devices for the 3-4 μm wavelength range

<u>M. Nedelikovic</u><sup>1</sup>, M.M. Milosevic<sup>2</sup>, T.M. Ben Masaud<sup>1</sup>, E. Jaberansary<sup>1</sup>, H.M.H. Chong<sup>1</sup>, G.T. Reed<sup>1</sup>, G.Z. Mashanovich<sup>1</sup>; <sup>1</sup>University of Southampton, ECS, FAPS (GB), <sup>2</sup>University of Surrey, Electronic Engineering (GB).

Mid-infrared waveguides, MMIs and racetrack resonators based on silicon on insulator platform have been designed, fabricated and characterised at the 3.7-3.8 µm wavelength range. Propagation loss of 5.9 dB/cm was measured for submicron silicon waveguides. [6149].....Pg. 511

### 10:00 STUDENT PRESENTATION Losses in Slotted Photonic Crystal Waveguides

M.G. Scullion<sup>1</sup>, A. Di Falco<sup>1</sup>, M. Massari<sup>2</sup>, S.A. Schultz<sup>1</sup>, F. Romanato<sup>2</sup>, T.F. Krauss<sup>1</sup>; <sup>1</sup>University of St Andrews, School of Physics and Astronomy (GB), <sup>2</sup>LANN Laboratory for Nanofabrication of Nanodevices (IT). Slotted photonic crystal waveguides promote strong lightmatter interactions in regions of low refractive index. We characterize the loss mechanisms that limit their performance, and show reduced coupling loss with a novel resonant coupler and propagation losses comparable to standard slot wavequides for given geometry. [6079] Pg. 512

### TOM 5

09:30 STUDENT PRESENTATION Photoinduced surface patterning of azobenzene-functionalized dendrons, dendrimers and dendronized polymers a comparative study

<u>J. Vapaavuori</u><sup>1</sup>, A. Priimagi<sup>1,2</sup>, E. Kasemi<sup>3</sup>, A.D. Schluter<sup>3</sup>, N. Canilho<sup>4</sup>, R. Mezzenga<sup>3</sup>, A.J. Soininen<sup>1</sup>, J. Ruokolainen<sup>1</sup>, O. lkkala<sup>1</sup>, M. Kaivola<sup>1</sup>; <sup>1</sup>Department of Applied Physics, Aalto University (FI), <sup>2</sup>Chemical Resources laboratory, Tokyo Institute of Technology (JP), 3ETH Zurich (CH), 4University of Fribourg (CH).

The formation of photoinduced surface-relief gratings was studied in a new set of azobenzenecontaining dendritic complexes. Of the three molecular architectures studied - dendrons, dendrimers and dendronized polymers - dendrimers were found to be the most favourable for the surface-relief inscription process. [5855].....Pg. 521

### 09:45

### Hybrid electro-optic polymer modulators and biophotonic sensors based on sol-gel silica waveguides

Y. Enami<sup>1</sup>, J. Luo<sup>2</sup>, A.K.-Y. Jen<sup>2</sup>; Research Institute for Nanodevice and Bio Systems, Hiroshima University (JP), <sup>2</sup>Department of Materials Science and Engineering, University of Washington (US).

We demonstrated hybrid electro -optic (EO) polymer modulators and biophotonic sensors based on a sol-gel silica waveguide. Photostable EO polymers were recently employed for the novel directional coupler modulators and multilayer slot waveguide modulators for ultra-low half wave voltage. We also briefly mention a biophotonic waveguide sensor using living protein in the sol-ael silica waveguide. [5813].....Pg. 523

# Room: Gordon A TOM 6

### 09:30 Strong third-harmonic generation in silicon nitride films T. Ning<sup>1</sup>, H. Pietarinen<sup>1</sup>, O.

Hyvärinen², J. Simonen², G. Genty<sup>1</sup>, <u>M. Kauranen<sup>1</sup></u>; <sup>1</sup>Dep. of Physics, Tampere University of Technology (FI), <sup>2</sup>Optoelectronics Research Centre, Tampere University of Technology (FI). We demonstrate strong thirdharmonic generation in silicon nitride films. The  $\chi^{(3)}$  susceptibility in silicon nitride films, determined by the Maker-fringe method, is two orders of magnitude larger than that of fused silica, and about twenty times larger than that previous reported values in silicon nitride. The result has a significant importance to future on-chip photonic devices. [5976] Pg. 525

### TOM 7 09:30 STUDENT PRESENTATION Optical properties of water under high pressure L. Weiss<sup>1,2,3</sup>, A. Tazibt<sup>1</sup>, A. Tidu<sup>3</sup>, M. Aillerie<sup>2</sup>; <sup>1</sup>Centre de Recher-

Room 10

che, d'Innovation et de Transfert Technologique en Jet Fluide (FR), <sup>2</sup>Lorraine University & Supelec. Laboratoire Matériaux Optiques Photonique et Systèmes (FR), <sup>3</sup>Lorraine University, Laboratoire d'Etude des Microstructures et Mécanique des Matériaux (FR). The refractive index and polarizability of water are precisely determined in the visible light range as a function of the pressure until 250 MPa by means of a new measurement technique and setup using special pipe tee included in an interferometer optical arrangement. [6004].....Pg. 529

### 09.45

### Strong multipole contribution to second-harmonic generation from silicon nitride films <u>R. Czaplicki</u><sup>1</sup>, G.P. Lakshmi

Narayanan<sup>1</sup>, T. Ning<sup>1</sup>, H. Pietarinen<sup>1</sup>, O. Hyvärinen<sup>2</sup>, J. Simonen<sup>2</sup>, G. Genty<sup>1</sup>, M. Kauranen<sup>1</sup>; <sup>1</sup>Tampere University of Technology, Dep. of Physics, Optics Laboratory (FI), <sup>2</sup>Tampere University of Technology, Optoelectronics Research Centre (FI). We show that second-harmonic generation from amorphous silicon nitride films has both dipole and higher-multipole contributions. Our results suggest that the highermultipole contribution is larger than that of any other material. [5944].....Pg. 527

### STUDENT PRESENTATION 09:45 Micro-Nano Integration of a III-N Nanowire Based Opto-chemical Detector

<u>R. Kleindienst</u><sup>1</sup>, V. Cimalla<sup>2</sup>, M. Eickhoff<sup>3</sup>, A. Grewe<sup>1</sup>, U. T. Schwarz<sup>2</sup>, J. Teubert<sup>3</sup>, S. Sinzinger<sup>1</sup>; <sup>1</sup>Technische Universität Ilmenau, IMN MacroNano, (DE), <sup>2</sup>Fraunhofer IAF, Dept. Optoel. Modules (DE), <sup>3</sup> Justus-Liebig-Universität Gießen, I. Physikalisches Institut (DE).

Due to the highly sensitive photoluminescence (PL) response to hydrogen (H<sub>2</sub>) and oxygen (O<sub>2</sub>), III-N nanowire heterostructures (NWHs) can be applied as optochemical transducers. In our contribution we describe the optical design and the fabrication of a robust and compact micro optical system realizing the integration of electro-optical components and NWHs. The potential of our approach is evaluated by profilometric characterizations and an investigation of the optical performance. Furthermore, we discuss the application as highly sensitive sensor system with fully integrated all optical readout for H<sub>2</sub>- or O<sub>2</sub>-concentrations in the ppm regime. [6071].....Pg. 531

### 09:45

### Invited talk Continuing education at Institut d'Optique Graduate School J.-L. Meyzonnette;

Institut d'Optique GS (FR). IOGS is one of the French academic institutions which offer a wide program of continuing education courses in optics/ photonics. Besides its traditional catalogue of courses held at its own site, it proposes also training sessions at industrial sites, participates in the European program SMETHODS and starts e-learning sessions. [5938] Pg. 533

[6172]Pg. 537	10:30 <b>High-order optical nonlinearities</b> <b>In dye sensitized DNA</b> <i>VI. Viad' I. Dancus', A. Petris',</i> <i>T. Bazaru Rujoiv', I. Rau<sup>2</sup>, F.</i> <i>Kajzar<sup>2</sup>, A. Meghea<sup>2</sup>; <sup>1</sup>National</i> <i>Institute for Laser Plasma and</i> <i>Radiation Physics, Department of</i> <i>Lasers (RO), <sup>2</sup>POLITEHNICA Uni-</i> versity of Bucharest, Department of Applied Physical Chemistry and Electrochemistry (RO). The aim of this work is to investi- gate the nonlinear optical prop- erties of dye sensitized DNA using femtosecond lasers. For this we are measuring the nonlinear refractive indices of the DNA + cetyltrimethylammonium (CTMA) doped with Rhodamine 610 (Rh), Disperse Red 1 (DR1) and Nile Blue (NB) dyes in water and butanol, at different concentra- tions. In this summary we are presenting our preliminary results underlining the interesting be- haviour of the refractive index changes in these samples due to the excitation of high-order nonlinearities. 10:00 STUDENT PRESENTATIO Widely and continuously tunable Optical Parametric Oscillator up to 4.8 µm based on 5%MgO: PPLN crystal cut as a cylinder V. Kemlin<sup>1</sup>, D. Jegouso<sup>1</sup>, J. Debray<sup>1</sup>, B. Menaert<sup>1</sup>, P. Segonds<sup>1</sup>, B. Boulanger<sup>1</sup>, H.

Ishizuki<sup>2</sup>, T. Taira<sup>2</sup>; <sup>1</sup>Institut Néel Centre National de la Recherche Scientifique - Université Joseph Fourier (FR), <sup>2</sup>Laser Research Center for Molecular Science, Institute for Molecular Science (JP).

An Optical Parametric Oscillator based on a 5%MgO:PPLN crystal engineered as a cylinder is reported. The cylinder is 5 mm thick with a 38 mm diameter. Continuous tuning is achieved from 1.35  $\mu m$  up to 4.8  $\mu m$  at room temperature. First energetical characterizations are presented. [5987].....Pg. 547

### Invited talk 10:15 Energy transfer in low dimension nonlinear waveguide arrays for telecommunications and fibre lasers

S. Turitsyn; Aston University (GB). A theory of coherent optical field propagation and energy transfer in low dimension array of coupled nonlinear waveguides. It is demonstrated that in the array with non-equal cores (e.g. with the central core) the stable steady-state coherent multi-core propagation is possible only in the nonlinear regime - with a power controlled phase matching. The developed theory of energy transfer in nonlinear discrete systems is rather generic and has a range of potential applications including both high power fibre lasers and ultra-high -capacity optical communication systems. [6286].....Pg. 549

STUDENT PRESENTATION

10:45-11:15	Coffee break (exhibition hall, Boyd Orr Suite)
Room: Fleming	Auditorium
11:15-12:00	PLENARY TALK   TOM 7 Optical Systems as an Enabling Technology for Ocean and Atmospheric Sciences and How We Understand Our Environment <u>C.N. McLean</u> , Office of Oceanic and Atmospheric Research, National Oceanic and Atmospheric Administration (US). The presentation will focus on the opportunity how much we know of our global environment with largely an ocean focus, and how very recent some major revelations have been made about the planet. Only a few decades have passed since the dis- covery of geologic formations containing quite alien life forms, which has led to the re-constitution of our understanding of life on Earth and how it evolved. Ocean optics will continue to contribute to this understanding. [6184]Pg. 558
12:00-12:45	PLENARY TALK   TOM 2 Silicon Photonics and the Future of Photonic Integration M.J. Wale; Oclaro Technology Ltd. (GB). Photonic integration is a breakthrough technology, enabling a wide range of applications to be addressed with compact, high-functionality, reliable and power efficient components that can be manufactured in a highly cost-effective manner. This talk seeks to set developments in silicon photonics in the context of wider technological developments and trends, show how developments in generic technology platforms could drive a revolution in cost and availability, offer some thoughts and sug gestions about how silicon can best be applied and discuss a possible future in which silicon and III-V semiconductor technolo gies could converge to offer even more exciting possibilities for the industry and applications community. [6282]Pg. 559
12:45-13:00 TOM 2	Post Testing Removal of Amorphous Silicon Bragg Gratings         Post deadline submission <u>R. Topley</u> <sup>1</sup> , R. Loiacono <sup>2</sup> , G. Mashanovich <sup>1</sup> , R. Gwilliam <sup>2</sup> , S.J. Henley <sup>2</sup> , G. Lulli <sup>3</sup> , R. Feldesh <sup>4</sup> , R. Jones <sup>5</sup> , G.T. Reed <sup>1</sup> ; <sup>1</sup> Southampton University (GB), <sup>2</sup> Advanced Technology Institute, FEPS, University of Surrey (GB), <sup>3</sup> Istituto per la Microelettronica ed i Microsistemi (IT), <sup>4</sup> Numonyx Memory Solution (IL), <sup>5</sup> Photonics Technology Labs, Intel Corporation (US).           We present empirical results of Bragg gratings, formed utilising an implantation technique to introduce disorder into the crystalline lattice. An extinction ratio of 35dB is demonstrated at 1350nm. Subsequent removal of the imposed lattice disorder is demonstrated using both laser and oven based techniques. [6424]Pg. 560

NOTES

14:45 STUDENT PRESENTATION Efficient pulse excitation of a nonlinear microcavity J. Oden, S. Trebaol, N. Dubreuil; Laboratoire Charles Fabry, Institut d'Optique, CNRS, Université Paris Sud (FR).

Nonlinear microcavities are known to exhibit an intensitydependent refractive index. This effect causes a mismatch between the resonance of the cavity and the input pulse frequency, resulting in a limitation of the energy coupling efficiency. We show here that a phase shaping of the input pulse allows to maintain the benefit of light localization. [5955] Pg. 584

### 15:00 STUDENT PRESENTATION Nonlinear imaging with confocal and interferometric SHG microscopy using a broadband 1550 nm fs-fiber laser

<u>A. Prylepa</u><sup>1,2</sup>, J. Duchoslav<sup>1,2</sup>, K. Hingerl<sup>2</sup>, D. Stiffer<sup>1,2</sup>; <sup>1</sup>Christian Doppler Laboratory for Microscopic and Spectroscopic Material Characterization (CDL-MS-MACH) (JP), <sup>2</sup>Center for Surface and Nanoanalytics (ZONA) Johannes Kepler University Linz (AT).

A confocal and interferometric second harmonic generation (SHG) microscope combined with linear low-coherence imaging capabilities was developed by using a broadband femtosecond fiber laser at 1550 nm and applied for the investigation of materials surfaces and subsurfaces. [6088].....Pg. 586

Diagnostic imaging of the Iridocomeal Angle for evaluation of Angle-closure glaucoma <u>V.M. Murukeshan<sup>1</sup></u>, V.K. Shinoj<sup>1,2</sup>, M.

Baskaran<sup>2</sup>, T. Aung<sup>2</sup>; <sup>1</sup>Center for Optical and Laser Engineering, School of MAE, Nanyang Technological University (SG), <sup>2</sup>Singapore Eye Research Institute & Singapore national Eye Center (SG).

Glaucoma is an eye disease associated with an increase in intraocular pressure which can lead to lead to blindness. The closed-angle or angle-closure glaucoma is related to closure of iridocorneal angle (ICA) corresponding to the area between the iris and cornea. The width of the ICA is associated with the drainage of aqueous humor from eye's anterior chamber. A wide angle permits adequate drainage of aqueous humor through the trabecular meshwork (TM)region provided the TM region is not obstructed. A narrow angle may obstruct the drainage system and at certain unfavorable conditions, can lead to acute angle-closure attack resulting in emergency care. Hence imaging of the region associated with the ICA is one of the thrust research area in vision research. This paper in this context briefly overviews some of the recent developments in high resolution imaging of anterior chamber angle. This will be followed by evaluation of the same using a probe based scheme developed by the authors. Both theoretical investigations and experimental validation of the same will be discussed in detail. Pg. 602

TOM1\_6001\_002 STUDENT PRESENTATION Discrimination of single yeast cells with Raman spectroscopy: Saccharomyces cerevisiae and Kluyveromyces lactis

<u>J.T. Heldens</u><sup>1</sup>, D.K. Leenman<sup>1</sup>, M.A.H. Luttik<sup>2</sup>, P.A.S. Daran-Lapujade<sup>2</sup>, J.T. Pronk<sup>2</sup>, J.

Caro<sup>1</sup>; <sup>1</sup>Delft University of Technology, Kavli Institute of Nanoscience and Department of Quantitative Imaging (NL), <sup>2</sup>Delft University of Technology, Kluyver Centre for Genomics of Industrial Fermentation and Department of Biotechnology (NL).

On the basis of Raman spectra of single cells we demonstrate clear discrimination of two yeast species, viz. *Saccharomyces cerevisiae* and *Kluyveromyces lactis*. The spectra have been measured with a laser tweezers Raman set-up, while they have been analysed with principle component analysis and linear discriminant analysis.....Pg. 604

### TOM1\_6134\_003

**Towards a real-time quantitative endoscopy** <u>L. Criante<sup>1</sup></u>, E. Stenta<sup>2</sup>, F. Simoni<sup>2</sup>; <sup>1</sup>Center for Nano Science and Technology Istituto Italiano di Tecnologia (IT), <sup>2</sup>Università Politecnica delle Marche, Dept.SIMAU (IT). We propose a new optimized optical fiber technology making available a real-time quantitative measurements during endoscopic surgery or examination. Based on the optical FOLCI technique the sensor provides very sensitive and precise measurements of size of the hollow organ in a non invasive way and without any calibration.....Pg. 606 TOM1\_6146\_004 STUDENT PRESENTATION High-throughput optical injection of mammalian cells using a Bessel beam

<u>H.A. Rendall<sup>T</sup></u>, R.F. Marchington<sup>5</sup>, B. Balagopal<sup>1</sup>, G. Bergmann<sup>6</sup>, Y. Arita<sup>1</sup>, A. Heisterkamp<sup>2</sup>, F.J. Gunn-Moore<sup>4</sup>, K. Dholakia<sup>1</sup>; <sup>1</sup>University of St. Andrews, Department of Physics (GB), <sup>2</sup>Friedrich Schiller University, Institute of Applied Optics (DE), <sup>3</sup>University of St. Andrews, School of Medicine (GB), <sup>4</sup>University of St. Andrews, School of Biology (GB), <sup>5</sup>University of St. Andrews, SUPA, School of Physics and Astronomy (GB), Max Planck Institute for Gravitational Physics (DE).

We present high throughput optical injection of mammalian cells with propidium iodide using a microfluidic platform. The microfluidic chip combines two-dimension hydrodynamic focusing of cells with a parallel, femtosecond Bessel beam. This allows for higher flow rates to be used whilst delivering the necessary laser dose....Pg. 608

### TOM 1 POSTER SESSION II

TOM1\_5846\_005 STUDENT PRESENTATION Femtosecond Photoporation of Intact BY-2 Suspension Cells

<u>C.A. Mitchell</u><sup>1</sup>, S. Kalies<sup>2</sup>, A. Heisterkamp<sup>3</sup>, L. Torrance<sup>4</sup>, A. Roberts<sup>4</sup>, F. Gunn-Moore<sup>5</sup>, K. Dholakia<sup>1</sup>; <sup>1</sup>University of St. Andrews, Department of Physics (GB), <sup>2</sup>Laser Zentrum Hannover e.V. (DE), <sup>3</sup>Friedrich Schiller University, Institute of Applied Optics (DE), <sup>4</sup>James Hutton Institute, Cell and Molecular Sciences (GB), <sup>5</sup>University of St. Andrews, School of Medicine (GB).

Successful femtosecond photoporation of plant cells has been demonstrated for the first time. Membrane impermeable substances have been optically injected into intact tobacco BY-2 cells whilst still retaining cell viability....Pg. 610

### TOM1\_5915\_007

LED and DPSS laser visual stimuli for evaluation of lutein and zeaxanthin macular pigment caused light extinction in human retina <u>M. Ozolinshi, 2</u>, P. Paulinsi; <sup>1</sup>University of Latvia (LV), <sup>2</sup>Institute of Solid State Physics, University of Latvia (LV). DPSS lasers and LEDs are used to develop heterochromatic flicker photometry setups for detecting macular pigments lutein and zeaxanthin. Light source emission spectra are selected to distinguish these pigment concentration levels in retina macula area due to

their local absorption maxima in blue spec-

# THURSDAY, 27 September 12:45 - 15:00

### TOM 2 POSTER SESSION II

### TOM2\_5966\_001 STUDENT PRESENTATION Spectral broadening enhancement in silicon waveguides through pulse shaping: physical insight

<u>D. Castelló-Lurbe</u><sup>1</sup>, E. Silvestre<sup>1</sup>, P. Andrés<sup>1</sup>, V. Torres-Company<sup>2,3</sup>; <sup>1</sup>Departament d'Òptica, Universitat de València (ES), <sup>2</sup>School of Electrical and Computer Enginnering, Purdue University (US), <sup>3</sup>Departament de Física, Universitat Jaume I (ES).

Spectral broadening of pulsed light in silicon waveguides is usually inhibit due to some adverse effects related to free carrier production. In this work, we discuss how to overcome these detrimental effects by using positive skew input pulses.....Pg. 614

### TOM2\_6440\_002 Post deadline submission Design of Mach-Zehnder interferometer sensor with calibration waveguide

<u>M. Kusko</u>; National Institute for Research and Development in Microtechnologies (RO). A Mach-Zehnder interferometer refractometric sensor has been designed for a monotonic sensor response if the analyte medium refractive index varies from 1.33 to1.36. The proposed sensor has a calibration waveguides to eliminate the influence ot the source power fluctations or the coupling misalignment.....Pg. 616

### THURSDAY, 27 September 12:45 - 15:00

### TOM2\_6425\_003 Post deadline submission Planar Bragg gratings in Silicon on Insulator fabricated using oxide synthesis

P.M. Waugh<sup>2</sup>, R. Topley<sup>3</sup>, R. Loiacono<sup>1</sup>, N.G. Emerson<sup>1</sup>, <u>G.T. Reed<sup>3</sup></u>; <sup>1</sup>Advanced Technology Institute, University of Surrey (GB), <sup>2</sup>Kimathi University (KE), <sup>3</sup>ORC, Southampton University (GB).

Two approaches have been used to demonstrate planar Bragg gratings, oxygen implantation and thermal oxidisation. Extinction ratios of 6.8dB and 8.5 dB are demonstrated respectively. This is comparable to the performance of early etched Bragg gratings in SOI.....Pg. 618

### TOM 3 POSTER SESSION I

### TOM3\_5817\_001

Geometrical Invisibility cloaking invisible light <u>H. Ichikawa</u>, M. Oura; Ehime University, Faculty of Engineering, (JP).

Achromatic optical cloaking is shown to be possible with the mere principle based on geometrical optics. Although its effect is approximate, what is observed with naked eyes is striking. The proposed technique would have applications not only in cloaking but also such as metrology.....Pg. 620

### TOM3\_5849\_002 STUDENT PRESENTATION Dynamic Surface-Enhanced Raman Spectroscopy of multidomain proteins

<u>T. Brulé</u><sup>1</sup>, H. Yockell-Lelièvre<sup>1</sup>, A. Bouhelier<sup>1</sup>, J. Margueritat<sup>1</sup>, L. Markey<sup>1</sup>, A. Dereux<sup>1</sup>, R. Quidan<sup>2</sup>, R. Seigneuric<sup>3</sup>, C. Garrido<sup>3</sup>, E. Finot<sup>1</sup>; <sup>1</sup>Laboratoire Interdisciplinaire Carnot de Bourgagne UMR CNRS 6303, Université de Bourgagne (FR), <sup>2</sup>ICFO-Institut de Ciènces Fotòniques (ES), <sup>3</sup>Heat Shock protein and Cancer INSERM UMR 866 IFR 100, Faculty of Medicine (FR).

The SERS gives the protein's fingerprint. In case of multidomain proteins, the standard way to study them is not really suited because of the different origins of SERS signal. That is why we have developed a method taking account of the molecular fluctuations which allow studying only few molecules in a solution....Pg. 622

### TOM3\_5861\_003 STUDENT PRESENTATION On sculptured thin films as platforms for optical sensing

<u>S.S. Jamaiana</u><sup>1</sup>, T.G. Mackaya<sup>2</sup>; <sup>1</sup>School of Mathematics and Maxwell Institute for Mathematical Sciences, University of Edinburgh (GB), <sup>2</sup>NanoMM-Nanoengineered Metamaterials Group, Department of Engineering Science and Mechanics, Pennsylvania State University (US).

Two independent modes of optical sensing based on sculptured thin films (STFs) were explored numerically in semi-empirical studies. One mode involved chemiluminescent emission whereas the other involved surfaceplasmon-polariton waves. Both studies suggest that STFs are promising platforms for optical sensing applications.....Pg. 624

### TOM3\_5876\_005

Plasmon-induced terahertz galvano- plasmonic response in a two-dimensional electron system gated by a periodic metal grating <u>D.V. Fateev</u>, V.V. Popov, S.A. Nikitov; Kotelnikov Institute of Radio Engineering and Electronics, Russian Academy of Science, Saratov (RU), Saratov State University (RU). Terahertz galvanoplasmonic response in a two-dimensional electron system gated by a periodic metal grating with an asymmetric unit cell is studied theoretically. It is shown that applying DC electric current leads to tremendous increase of the galvanoplasmonic response.....Pg. 626

### TOM3\_5896\_006 Direct Measurement of the Radiation Pattern of a Nanoantenna Dipole Array

J. Stokes<sup>1</sup>, P.Bassindale<sup>2</sup>, J.W. Munns<sup>2</sup>, Y. Yu<sup>1</sup>, Z.H. Yuan<sup>6</sup>, G.S. Hilton<sup>1</sup>, J.R. Pugh<sup>1</sup>, A. Yang<sup>1</sup>, A. Collins<sup>4</sup>, P.J. Heard<sup>3</sup>, R.Oulton<sup>1,5</sup>, A. Sarua<sup>5</sup>, M. Kuball<sup>5</sup>, A.J. Orr-Ewing<sup>4</sup>, M.J. Cryan<sup>1</sup>; <sup>1</sup>Department of Electronic and Electrical Engineering, <sup>2</sup>Bristol Centre for Functional Nanomaterials, <sup>3</sup>Interface Analysis Centre, <sup>4</sup>School of Chemistry, <sup>5</sup>School of Physics, University of Bristol (GB), 6 Guizhou University For Nationalites, Guiyang (CN). Scanning microphotoluminescence is used to characterise the fluorescence from a dyeloaded polymer deposited on a 5 x 5 nanoantenna dipole array. Vertical and horizontal scans show anisotropic emission patterns. Pg. 628

### WEDNESDAY, 26 September 13:00 - 15:10

Template guided gold clusters nanostructuting

<u>D.A. Grynko</u><sup>1</sup>, M.A. Zabolotny<sup>2</sup>, M.Yu. Barabash<sup>3</sup>, Yu.M. Barabash<sup>4</sup>; <sup>1</sup>Institute of Semiconductor Physics NAS of Ukraine, Kyiv (UA), <sup>2</sup>Kyiv National Taras Shevchenko University (UA), <sup>3</sup>Technical Center of NAS of Ukraine (UA), <sup>4</sup>Institute of Physics NAS of Ukraine, Kyiv (UA).

Template is a functionally organized in space mikroinstrument to direct physical and chemical processes of nanoobjects selforganization in space and time by interaction with its surface via the local field. Strong, spatially organized electrostatic field of template influence the nucleation and diffusion transport of nanoparticles....Pg. 630

### TOM3\_5906\_008

Direct measurement of ultrahigh optical Qfactors of individual liquid microdroplets using tapered optical fiber waveguides Y. Karadag, A. Jonáš, M. Mestre,

<u>A. Kiraz;</u> Koç University, Dept. of Physics (TR).

Ultrahigh quality factors of the optical whispering gallery modes of surface-supported microdroplets were directly measured via tapered optical fibers. Quality factors up to 1.85 ×10<sup>6</sup> were observed for glycerol-water droplets with radii < 200 µm....Pg. 632

### TOM3\_5920\_009

Optical reflective Galois scattering plates <u>M. Jaax</u><sup>1</sup>, B. Lägel<sup>2</sup>, S. Wolff<sup>2</sup>, H. Fouckhardt<sup>1</sup>; Kaiserslautern University of Technology, <sup>1</sup>Physics Department, Integrated Optoelectronics and Microoptics Research Group, <sup>2</sup>Nano Structuring Center, Kaiserslautern (DE).

Surfaces structured with binary Galois reliefs scatter incoming waves in a wide range of solid angles. The Galois array design is already well known for acoustic waves. To date, this concept has not been investigated in the context of THz frequencies or optical wavelengths. Here, a proof of concept is presented that shows that Galois surfaces are excellent light diffusers.....Pg. 634

### TOM3\_5954\_011 STUDENT PRESENTATION Nanoparticle trapping and structuring on the surface of photovoltaic lithium niobate crystals and waveguides

H. Burgos<sup>1</sup>, <u>M. Jubera</u><sup>1</sup>, A. García-Cabañes<sup>1</sup>, F. Agulló-López<sup>1,2</sup>, M. Carrascosa<sup>1</sup>; <sup>1</sup>Universidad Autónoma de Madrid, Dept. Física de Materiales (ES), <sup>2</sup>CMAM, Universidad Autónoma de Madrid, (ES).

Micro/nanoparticle trapping and structuring on the surface of LiNbO<sub>3</sub> crystals and optical waveguides has been observed. Conductive and dielectric particles have been periodically structured up to periods of a few microns. The role of the deposition method and illumination geometry has been investigated. Pg. 636

### TOM3\_5979\_012 STUDENT PRESENTATION Analytical reverse engineering of index maps for the design of all-dielectric metametarials

E. Cassan, K. Van Do, <u>C. Caer</u>; Institut d'Electronique Fondamentale, Univ. Paris-Sud, CNRS (FR).

An analytical method is proposed for the design of all-dielectric metamaterials at optical frequencies as an alternative to the formalism of transformation optics. It is applied to the design of broadband weaklyopen in-plane light trajectories like logarithmic spirals in the silicon on insulator photonics technology which could be hardly described by the use of coordinate transforms...Pg. 638

### TOM3\_6008\_014 STUDENT PRESENTATION Optimization of light absorption in semiconductor nano-pillar array solar cells

<u>B. Dev Choudhury</u><sup>1</sup>, E. Ebraert<sup>1,2</sup>, S. Anand<sup>1</sup>; <sup>1</sup>KTH- The Royal Institute of Technology, School of Information and Communication Technology (SE), <sup>2</sup>Vrije Universiteit Brussel (BE).

We present a detailed analysis and optimization of light absorption in Si, InP and GaAs (air gap and dielectric planarized) nano-pillar (NP) arrays using finite difference time domain (FDTD) method. For maximum absorption, optimal values of diameter and spacing were in the range 150-250 nm and 300-400 nm, respectively.....Pg. 640

### TOM3\_6019\_015 STUDENT PRESENTATION LINbO3 Bragg gratings with giant aspect ratios

<u>C. Guyot</u><sup>1</sup>, N. Courjal<sup>1</sup>, G. Ulliac<sup>1</sup>, B. Guicharchaz<sup>1</sup>, H. Lu<sup>1</sup>, B. Sadani<sup>1</sup>, M.-P. Bernal<sup>1</sup>, F. Baida<sup>1</sup>; <sup>1</sup>Département d'Optique P.M. Duffieux, Institut FEMTO-ST UMR 6174 CNRS Université de Franche-Comté, Besancon (FR).

We present LiNbO<sub>3</sub> Bragg gratings with an aspect ratio of 8 and beyond. The gratings are integrated in ridge waveguides by focused ion beam (FIB) milling. The preliminary optical characterizations confirm that the gratings behave as reflectors....Pg. 642

### TOM3\_6034\_017 Phase visualization by using layered metamaterials

<u>R. Kasztelanic</u>, A. Pastuszczak, M. Stolarek, R. Kotyński; University of Warsaw, Faculty of Physics, Warsaw (PL).

We describe layered metal-dielectric metamaterials using the model of a linear-shiftinvariant system. In a computer simulation we demonstrate that this kind of metamaterial behaves similarly to high-pass spatial filter and it is possible to use it for phase visualization.....Pg. 644

### TOM3\_6046\_018 Using photonic crystal nanocavities as nearfield optical tweezers

C. Renaut<sup>1,2,3</sup>, B. Cluzel<sup>1</sup>, J. Dellinger<sup>1</sup>, L. Lalouat<sup>1</sup>, E. Picard<sup>2</sup>, D. Peyrade<sup>3</sup>, E. Hadij<sup>2</sup>, <u>F. de Fornel<sup>1</sup></u>; <sup>1</sup>Groupe d'Optique de Champ Proche - LRC CEA n DSM-08-36, Laboratoire Interdisciplinaire Carnot de Bourgogne, UMR CNRS 6303, Université de Bourgogne (FR), <sup>2</sup>Laboratoire Silicium Nanoélectronique Photonique et Structures, INAC/SP2M/ SiNaPS, CEA (FR), <sup>3</sup>CNRS/UJF-Grenoble <sup>1</sup>/ CEA LTM (FR).

Silicon On Insulator (SOI) optical nanoresonators achieve spectral and spatial confinement of the electromagnetic field. These small modal volumes nanocavities carry driven optical forces paving the way to emerging applications in optomechanics and lifescience. In this work, we report optical trapping and assembly experiments of micrometer-sized dielectric particles (1 µm in diameter) leaning on the near-field distribution of two evanescently coupled nanocavities....Pg. 646

NOTES

### TOM3\_6053\_019

### Hyperspectral near-field imaging of light bending in a graded photonic crystal

J. Dellinger<sup>1</sup>, B. Cluzel<sup>1</sup>, <u>F. de Fornel<sup>1</sup></u>, K.V. Do, E. Cassan; <sup>1</sup>Groupe d'Optique de Champ Proche, Laboratoire Interdisciplinaire Carnot de Bourgogne, UMR CNRS 6303 (FR), <sup>2</sup>IEF - Université Paris Sud (FR). Artificial materials at optical frequencies have raised a strong interest in the last years, including photonic metamaterials. graded photonic crystals, and simple gradient index structures. The main common objective of these approaches is achieving a tight control of the electromagnetic guided-wave fields to play with light properties and propose versatile optical functions. In this general context, photonic crystals (PCs) and gradual photonic crystals (GPhCs) working in the diffraction regime, i.e. close to the photonic crystal (PhC) bandgap are good candidates to control the path and the dispersion of light beams on a chip. In this work, we report the observation of the fascinating mirage effect in a silicon GPhC using a hyperspectral scanning near-field optical microscope (Hyp-SNOM). The Hyp-SNOM allows a spectrally and spatially continuous near-field imaging of the complex electromagnetic waves dispersion inside the GPhCs, and thus giving back insight into the physics underlying the reported phenomena. The experimental observations are compared to the numerical predictions based on 3D planewaves calculations of the GPhCs dispersion diagram and Hamiltonian Optics propagation of light.....Pg. 647

### TOM3\_6058\_020

### Hyperspectral near-field imaging for nanophotonics

J. Dellinger, L. Lalouat, B. Cluzel, <u>F. de Fornel</u>; Groupe d'Optique de Champ Proche, Laboratoire Interdisciplinaire Carnot de Bourgogne, UMR CNRS 6303 (FR). The scanning near-field optical microscopy (SNOM) is used to analyze optical phenomena at the sub-wavelength scale such as light localization and propagation in photonic crystals or plasmonic devices. In any case, SNOM experiments rely on the positioning of a local probe in the optical near field of a given structure and on the detection of the surrounding evanescent waves. Depending on the nature of the

probe or on the optical detection method, the detected physical properties are the spatial distributions of the amplitude and phase or the intensity of the electric and magnetic components of the probed field. In this paper, we present the implementation of an innovative hyperspectral near-field imaging method which aims to detect both spectral and spatial properties of an optical nanosystem at the subwavelength scale. Pg. 648

### TOM3\_6060\_021

Near-field interactions between a photonic crystal nanocavity and a near-field probe L. Lalouat<sup>1</sup>, B. Cluzel<sup>1</sup>, K. Foubert<sup>1,2</sup>, J. Dellinger<sup>1</sup>, M. Ding<sup>3</sup>, G. Brambilla<sup>3</sup>, E. Picard<sup>2</sup>, E. Hadji², D. Peyrade₄, <u>F. de Fornel</u>¹; ¹Groupe d'Optique de Champ Proche LRC CEA n 08-36, Laboratoire Interdisciplinaire Carnot de Bourgogne, UMR CNRS n 6303-Université de Bourgogne (FR), <sup>2</sup>Laboratoire Silicium Nanoélectronique Photonique et Structures, INAC/SP2M/SiNaPS, CEA (FR), <sup>3</sup>Optoelectonics Research Centre, University of Southampton (GB), <sup>4</sup>Laboratoire des Technologies de la Microélectronique, CNRS (FR). Semiconductor photonic crystal resonators have attracted much attention over the last recent years. Their potential for high quality (high Q) factor in small volume (small V) cavities opens innovative ways to control light. As proposed theoretically few years ago, the near-field probes permit to tune their resonances opening the route towards near-field probes opto-mechanical devices. Pg. 649

### TOM3\_6070\_022 Plasmon-like Surface States in Negative Refractive Index Metamaterials: an Experimental Characterization

E. De Tommasi<sup>1</sup>, A. C. De Luca<sup>2</sup>, P. Dardano<sup>1</sup>, S. Cabrini<sup>3</sup>, I. Rendina<sup>1</sup>, V. Mocella<sup>1</sup>; <sup>1</sup>National Council for Research, Institute for Microelectronics and Microsystems, Department of Naples (IT), <sup>2</sup>National Council for Research, Institute for the Biochemistry of Proteins, Naples (IT), <sup>3</sup>Molecular Foundry, Lawrence Berkeley National Laboratory (US). Surface states at the boundary of a negative refractive index metamaterial have been theoretically predicted and their angular dispersion experimentally reconstructed by means of a typical evanescent field coupling technique based on the use of a high refractive index prism. Possible applications in biochemical sensing schemes are proposed.....Pg. 650

### TOM3\_6097\_023 Assessment of novel ingredients within Fourier modal methods

P. Kwiecien<sup>1</sup>, I. Richter<sup>1</sup>, <u>J. Čtyroký</u><sup>2</sup>; <sup>1</sup>Department of Physical Electronics, Faculty of Nuclear Sciences and Physical Engineering, Czech Technical University in Prague (CZ), <sup>2</sup>Institute of Photonics and Electronics AS CR (CZ).

Based on two our algorithms of Fourier modal methods (FMM), we investigated several alternative approaches to (correct) Fourier factorization rules, and to the adaptive spatial resolution (ASR) techniques. Their practical applicability is demonstrated on several examples of photonic and/or plasmonic nanostructures.....Pg. 652

### TOM3\_6112\_024 STUDENT PRESENTATION Optical Properties of Rhodium 2,2'-Biimidazole Carbonyl Complex

<u>B. Chandra</u><sup>1</sup>, E. Laurila<sup>2</sup>, H. Lajunen<sup>1</sup>, J. Turunen<sup>1</sup>, P. Vahimaa<sup>1</sup>, M. Haukka<sup>2</sup>; <sup>1</sup>University of Eastern Finland, Department of Physics and Mathematics (FI), <sup>2</sup>University of Eastern Finland, Department of Chemistry (FI). The optical properties of Rhodium 2,2<sup>1</sup>-Biimidazole Carbonyl crystals are investigated using ellipsometric measuring techniques. The crystals are shown to be strongly anisotropic over a band of visible wavelengths.....Pg. 654

### TOM3\_6158\_025 lonising Radiation Detectors and Dosimeters based on Quantum Dots

*R. Baharin<sup>1</sup>, <u>P.R. Hobson<sup>1</sup></u>, D.E. Leslie<sup>2</sup>, D.R. Smith<sup>1</sup>; <sup>1</sup>Brunel University, School of Engineering & Design, Uxbridge (GB), <sup>2</sup>Brunel University, School of Sport & Education (GB). We report measurements of the effect on the fluorescent emission of commercially produced CdSe/ZnS quantum dots of 2.5 nm, 3.3 nm and 6.3 nm size in toluene, following exposure to 1 MeV gamma irradiation and 6 MeV electron irradiation in the range 0.1-110 Gy. A prototype radication dosimeter using these is presented.....Pg. 656* 

TOM3 6419 051 Post deadline submissio The core modes of all solid photonic band gap fibers as bound states in the continuum A.D. Pryamikov; Fiber Optics Research Center of Russian Academy of Sciences (RU). In this paper we propose a new hypothesis of out of plane band gap formation in all solid photonic band gap (PBG) fibers. One considers the process of the core mode formation as a result of excitation of continuous mode spectrum of single dielectric rod of the claddina. In this case, the core modes are the transverse resonances of a set of radiation modes decoupled from the continuum provided that the phase matching conditions between the propagation constant of the core mode and propagation constants of the continuous modes are fulfilled.....Pg. 658

TOM3\_6417\_052 Post deadline submission Plasmonic Coupling to Microoptical Systems <u>C.A. Jones</u>, A.G. Edelmann; Optical Information Technology, University of Hagen (DE). With increased prevalence of plasmonics it will become more necessary to perform complex operations on the transmitted information. One simple way of achieving this on optical signals is in the Planar Integrated Free Space Optics (PIFSO) technology. It is to be shown how PIFSO can be coupled with plasmonics.....Pg. 661

# TOM3\_6411\_053 Post deadline submission Nanophotonic device based on gold nanoparticles for biomedical applications

R. lovine, <u>L. La Spada</u>, L. Vegni; "RomaTre" University, Department of Applied Electronics (IT).

An LSPR (Localized Surface Plasmon Resonance) sensor, based on near field interaction of coupled nanoinclusions, arranged in array configuration, is proposed. The sensor is designed to detect in/organic compounds by refractive index measurements. The results demonstrate that the proposed sensing platform is suitable for biomedical applications in the near infrared frequency region. Pg. 663

### STUDENT PRESENTATION

TOM3\_6410\_054 Post deadline submission Multipole approach to optical nanomaterials <u>P. Grahn</u>, A. Shevchenko, M. Kaivola; Aalto University, Department of Applied Physics (FI).

We present a convenient theoretical model for the design and characterization of optical nanomaterials in terms of electromagnetic multipole moments that light can excite in the structural units of the material...Pg. 665

### TOM 3 POSTER SESSION II

### TOM3\_5806\_026 Optimization of GaAsSb/GaAs quantum dot lasers

<u>T.H. Loeber</u>, C. Heisel, J. Strassner, J. Richter, D. Hoffmann, H. Fouckhardt; Kaiserslautern University of Technology, Physics Department, Integrated Optoelectronics and Microoptics Research Group (DE). Efficient electrically pumped GaAsSb quantum dot (QD) lasers on GaAs substrate are realized. For further improvement of the devices growth procedure and processing are optimized. The claddings and the doping concentrations are controlled during growth by reflectance anisotropy spectroscopy (RAS).....Pg. 667

### TOM3\_5809\_027

### Characterization of flexible holographic imprints in urea-silicate and amine-alcoholsilicate matrices with embedded metal nanoparticles.

S.D. Moreira<sup>1,2</sup>, C.J.R. Silva<sup>1</sup>, M.F.M. Costa<sup>2</sup>, L.A.S.A. Prado<sup>3</sup>, M. de Jesus M. Gomes<sup>2</sup>; <sup>1</sup>Department of Chemistry, Universidade do Minho (PT), <sup>2</sup>Center of Physics, Universidade do Minho (PT), <sup>3</sup>Institute of Polymer and Composites, TU Hamburg-Harburg (DE). This work reports the synthesis and characterization of the optical elastic thermal and dimensional properties of transparent gels based on a hybrid matrix obtained by solgel method. Sol-gel method is an adequate method to produce highly transparent and stable materials where different types of components could be dispersed, such as nano -sized metal nanoparticles (gold and silver), promoting the enhancement of the original matrix optical properties. This work was focused on the optimization of preparative routines to obtain materials for the development of high resolution gratings by replica molding technique.....Pg. 669

### TOM3\_5810\_028 Grating-assisted LR-SPP coupling: introducing 3D numerical analysis

M.P. Bolzani<sup>7</sup>, G.G. Gentili<sup>7</sup>, <u>S.M.</u> <u>Pietralunga<sup>2</sup></u>; <sup>1</sup>Politecnico di Milano, Dip. Elettronica e Informazione (IT), <sup>2</sup>CNR-IFN (IT). A full-wave Finite Element Method 3D numerical analysis of grating-assisted coupling of Long-Range Surface Plasmon Polariton modes into strip waveguides is introduced. For an input Gaussian beam and 1D grating coupler, comparison with commonly used 2D approximated analysis shows marked differences in coupling efficiency estimate. Pa. 670

### TOM3\_5819\_029

### Fiber Bragg Grating Based Surface Plasmon Resonance Biosensors

P.T. Arasu<sup>1</sup>, <u>A.S.M. Noor<sup>1,2</sup></u>, Y. Al-Qazwini<sup>1</sup>, B.I. Onn<sup>1</sup>; <sup>1</sup>Wireless and Photonic Network Research Center, Faculty of Engineering University Putra Malaysia (MY), <sup>2</sup>Department of Computer and Communications System Engineering Faculty of Engineering University Putra Malaysia (MY).

A fiber Bragg grating (FBG) based surface Plasmon resonance (SPR) sensor is investigated using 2-D finite difference time domain (FDTD) simulation. The sensitivity of the sensor with and without gratings is observed as well as the effect of changing the grating distance on the resonant wavelength. Pg. 672

### TOM3\_5836\_030 Resonant coupling between surface polaritons and QD excitons in metal-QD heterostructures

Yu. V. Bludov, <u>M.I. Vasilevskiy</u>; Centro de Fisica, Universidade do Minha (PT). Coupling of plasmon-polaritons propagating along the interface between a metal and a dielectric layer containing embedded nanocrystal (NC) quantum dots (QDs), to excitons confined in the QDs is studied theoretically. It is shown that this coupling produces a considerable effect on the optical properties of the heterostructure....Pg. 674

### TOM3\_5854\_031

# Tunable liquid-crystal long-range plasmonic stripe waveguides

*R. Beccherelli, <u>D.C. Zografopoulos</u>; Consiglio Nazionale delle Ricerche; Istituto per la Microsistemi (CNR-IMM) (IT).* The optical properties of gold stripe waveguides enhanced with a liquid-crystal overlayer are theoretically investigated. It is shown that by proper selection of material and structural parameters extensive tunability of modal effective index, area and losses can be achieved via the electro-

optic control of the nematic molecules. Pg. 676

### TOM3\_5869\_032 STUDENT PRESENTATION Nanocone-based sensor for blood disease detection

<u>L. La Spada</u>, R. lovine, L. Vegni; University of "RomaTre", Department of Applied Electronics (IT).

In this paper the design of a gold conic nanoparticle array is proposed. New analytical formulas are obtained in order to describe their resonant behavior. The numerical results suggest that the proposed structure can be used as a sensing platform for the detection of blood diseases. Pg. 678

### THURSDAY, 27 September 12:45 - 15:00

### TOM3\_5903\_033 Formation of inclined wavefront through planar stacked hole array

<u>T. Matsui</u><sup>1</sup>, A. Miura<sup>1</sup>, T. Nomura<sup>1</sup>, H. Fujikawa<sup>1</sup>, K. Sato<sup>1</sup>, N. Ikeda<sup>2</sup>, D. Tsuya<sup>2</sup>, M. Ochia<sup>2</sup>, H. T. Miyazaki<sup>2</sup>, and Y. Sugimoto<sup>2</sup>; <sup>1</sup>Toyota Central R&D Labs., Inc., Aichi (JP), <sup>2</sup>National Institute for Materials Science, Tsukuba (JP).

Transmission phase control is experimentally demonstrated using stacked metal-dielectric hole arrays with a two-dimensional geometric design. Inclined wavefront through planar structure, for beam steering application, is also proposed. Inclined wavefront is realized by the use of the element which have gradually changing hole shapes in-plane.....Pg. 680

### TOM3\_5917\_034 Plasmonic structures on photonic crystals: preparation and characterization

V. Robbiano<sup>1,2</sup>, M.C. Giordano<sup>2</sup>, C. Martella<sup>2</sup>, F. Buatier de Mongeot<sup>2</sup>, <u>D. Comoretto<sup>1</sup></u>; <sup>1</sup>Università degli Studi di Genova, Dipartimento di Chimica e Chimica Industriale, Genova (IT), <sup>2</sup>Università degli Studi di Genova, Dipartimento di Fisica, Genova (IT). We report on the optical response of gold nanocrescents evaporated over artificial opals. Nanocrescents shows three resonances due to their specific shape. When plasmonic resonances spectrally overlap to the photonic stop band of the opals, a dramatic change in its spectral position and dispersion is observed....Pg. 682

### TOM3\_5919\_035 STUDENT PRESENTATION Near UV nanoplasmonics of radially symmetric metal-dielectric structures

<u>K. Ushakova</u>, S.F. Pereira, H.P. Urbach; Delft University of Technology, Faculty of Applied Sciences, Department of Imaging Science & Technology, Optics Research Group (NL). Surface plasmons in the near UV wavelength range in radially symmetric metaldielectric structures consisting of sub wavelength concentric nanoslit grooves are inspected by applying 1D grating and coaxial metaldielectric-metal waveguide models. Pg. 684

### Room: exhibition hall, Boyd Orr Suite

### TOM3\_5921\_036

### In-plane remote optical excitation of semiconducting single-walled carbon nanotube by propagating surface plasmon

P. Rai<sup>1</sup>, J. Berthelot<sup>1</sup>, N. Hartmann<sup>2</sup>, A. Hartschuh<sup>2</sup>, A. Bouhelier<sup>1</sup>; <sup>1</sup>Laboratoire Interdisciplinaire Carnot de Bourgogne, CNRS UMR 6303, Université de Bourgogne (FR), <sup>2</sup>Department Chemie and CeNS, Ludwig-Maximilians-Universität München (DE). We present propagating surface plasmon polariton (SPP) coupled exciton generation in semiconducting single-walled carbon nanotube (SWNT) at room temperature. Our results demonstrate that nanotube can act as a sensor for propagating SPP in metal structure and enables the routes towards integration of plasmonic and nanophotonic circuits based on carbon nanotubes (CNTs). Pg. 686

### TOM3\_6032\_040 STUDENT PRESENTATION Fabrication of GaAs nanopillars with optimized design for enhanced sunlight absorption

<u>R. Sanatinia</u>, K.M. Awan, S. Naureen, E. Ebraert, B.D. Choudhury, S. Anand; School of Information and Communication Technology, KTH Royal Institute of Technology (SE). GaAs nanopillar arrays are fabricated based on a design optimized for solar light absorption by 3D finite difference time domain simulations. The pillars fabricated using nanosphere lithography and dry etching show a dramatic decrease in total reflectivity and a 2-fold improvement in photoluminescence after surface passivation. Pg. 692

### TOM3\_6057\_043 STUDENT PRESENTATION Fabrication and optical properties of single and bimetallic periodic array of different noble metals

<u>A. Mansourian</u>, M. Nasir, W. Dickson, D. O'Connor, R. McCarron, G. Wurtz, A.V. Zayats; Nano-optics and Near-field Spectroscopy Group, Department of Physics, King's College London (GB).

We discuss the design and fabrication details and electro-deposition of periodic arrays of different noble metals such as gold, silver and nickel into the pores of an aluminium oxide membrane prepared by two step anodization. The optical properties of these structures are characterised.....Pg. 698

### TOM3\_5945\_037 STUDENT PRESENTATION Near-field optical imaging of dielectricloaded surface plasmonpolariton waveguides using optical feedback on erbium fiber laser

<u>M. Roblin</u><sup>1</sup>, S. Girard<sup>1</sup>, M. Laroche<sup>1</sup>, H. Gilles<sup>1</sup>, C. Dufour<sup>1</sup>, J. Cardin<sup>1</sup>, U. Lüders<sup>2</sup>; <sup>1</sup>Centre de recherche sur les lons, les Matériaux et la Photonique (CIMAP), UMR, 6252 CEA-CNRS-ENSICAEN, Université de Caen (FR), <sup>2</sup>CRISMAT, Laboratoire de cristallographie et sciences des matériaux, UMR 6508, CNRS-ENSICAEN, Université de Caen (FR).

Heterodyne optical feedback on class-B solid state laser is applied for characterizing dielectric-loaded surface plasmon-polariton waveguides (DLSPPW) at telecom wavelength. Near-field optical images recorded on a series of DLSPPWs are compared to numerical models (mode-solver and finite-difference time-domain). Pg. 688

### TOM3\_6000\_038 Gain in Rayleigh scattering from nanoparticles trapped in photonic crystal membranes

J.O. Grepstad<sup>1,2,3</sup>, P. Kaspar<sup>4</sup>, O. Solgaard<sup>5</sup>, I.-R. Johansen<sup>2</sup>, <u>A.S. Sudbø</u><sup>3,6</sup>; <sup>1</sup>Department of Electronics and Telecommunications, Norwegian University of Science and Technology, Trondheim (NO), <sup>2</sup>SINTEF ICT, Microsystems and Nanotechnology (NO), <sup>3</sup>University Graduate Center (NO), <sup>4</sup>Electronics Laboratory, ETH Zurich, (CH), <sup>5</sup>E.L. Ginzton Laboratory, Stanford University (US), <sup>6</sup>Department of Physics, University of Oslo (NO). Rayleigh scattering of light by nanoparticles in free space can be increased by placing the particles in the holes of a photonic crystal membrane, making them more visible in a microscope. We show in simulations that the scattering gain can be as large as a factor of 10 in the hole-center, and even larger near the hole wall.....Pg. 690

### TOM3\_6036\_041 Laser emission from core or shell transitions in self-assembled microcavities of CdSe/CdS colloidal quantum rods

<u>M. Zavelani-Rossi</u><sup>1</sup>, R. Krahne<sup>2</sup>, G. Della Valle<sup>1</sup>, F. Scotognella<sup>1</sup>, S. Longhi<sup>1</sup>, I. Franchini<sup>3</sup>, S. Girado<sup>3</sup>, D. Pisignano<sup>3</sup>, L. Manna<sup>2</sup> G. Lanzani<sup>1,4</sup>, F. Tassone<sup>4</sup>; <sup>1</sup>Dipartimento di Fisica Politecnico di Milano, IFN-CNR (IT), <sup>2</sup>Fondazione Istituto Italiano di Tecnologia (IT), <sup>3</sup>NNL-CNR-Ist. Nanoscienze, Dip. di Ingegneria dell'Innovazione e Dip. Di Matematica e Fisica, Università del Salento, Lecce (IT), <sup>4</sup>Center for Nano-Science and Technology (IT).

We show laser action, in the red or in the green, from transitions in the *core* or in the *shell* of colloidal CdSe/CdS nanorods (NRs). The laser micro-resonator is obtained merely by self-assembling of the NRs following capillary jet deposition of NR solution. The laser has low pump threshold and its behavior is fully modeled.....Pg. 694

### TOM3\_6045\_042 Silica-coated tilted fiber Bragg grating for anion recognition

E. Malheiro<sup>1</sup>, L. Melo<sup>1</sup>, R. Pinto<sup>2</sup>, J. Rodrigues<sup>3</sup>, A. Farinha<sup>3</sup>, N. J. Alberto<sup>1</sup>, L. Bilro<sup>1</sup>, T. Trindade<sup>2</sup>, J. Tomé<sup>3</sup>, R.N. Nogueira<sup>1</sup>; <sup>1</sup>Instituto de Telecomunicações (PT), <sup>2</sup>University of Victoria, Department of Mechanical Engineering (CA), <sup>2</sup>Universidade de Aveiro, CICECO Complexo de Laboratórios Tecnológicos (PT), <sup>3</sup>Universidade de Aveiro, Departamento de Química (PT). In this work, it is presented the influence of a silica nanofilm onto a tilted fiber Braga grating (TFBG) for anion recognition. A TFBG was tested before and after silica coating regarding different chloride concentrations. The results show that this technique improves the TFBG's sensitivity towards chloride detection.....Pg. 696

### TOM3\_6067\_044 STUDENT PRESENTATION Enhanced Nonlinear Optical Effects with a self-collimating photonic crystal

<u>S. Romano</u><sup>1</sup>, I. Rendina<sup>1</sup>, S. Cabrini<sup>2</sup>, V. Mocella<sup>1</sup>; <sup>1</sup>CNR-IMM – Unità di Napoli (IT), <sup>2</sup>Molecular Foundry, Lawrence Berkeley National Laboratory (US). Negative refraction in dielectric photonic crystals (PhC) allows phenomena that are impossible with conventional optics, such as a self-confinement of the radiation. In this paper we show how this property can lead to an enhancement of up-conversion field in Er<sup>3+</sup> nanoparticles drop-casted on a PhC surface....Pg. 700

### TOM3\_6090\_045 Surface plasmon polariton-controlled tunable quantum-dot emission

<u>P. Törmä</u>, R.J. Moerland, H.T. Rekola, G. Sharma, A.-P. Eskelinen, A.I. Väkeväinen; Aalto University, Department of Applied Physics (Fl).

In many cases, the emission wavelength of the quantum dots is fixed after manufacturing, allowing no control over the in situ emission properties. Here, we showfully optical, insitutunability of the emission wavelength of quantum dots, with shifts of over 30 nm, employing Surface Plasmon Polaritons to control the emission wavelength. Pg. 703

Room: exhibition hall, Boyd Orr Suite

### TOM3 6098 046

Single-layer Multifrequency Plasmonic Cloak J. Zhang<sup>1,2</sup>, A. Zayats<sup>1</sup>; <sup>1</sup>King's College London, Department of Physics (GB), <sup>2</sup>Technical University of Denmark, Department of Photonics Engineering-DTU Fotonik (DK). We propose to use single layer plasmonic covers with non-uniform thickness to reduce the total scattering cross section of cylindrical objects at multiple frequencies. Analytical studies based on transformation optics and numerical simulations are performed to demonstrate the functionality of this cloak. Pg. 705

### TOM3\_6102\_047

High Q micro ring resonator with implemented hollow core defects for optical sensing

M. Gabalis, D. Urbonas, <u>R. Petruskevicius;</u> Center for Physical Sciences and Technology (LT).

By implementing defects into the micro ring resonator we are able to "localize" E field in analyte and achieve high Q-factor. "Localization" of light in analyte enhances the biosensing and high Q-factor increases the accuracy in detecting the wavelength shift.....Pg. 707

### TOM3 6118 048

Giant enhancement of terahertz radiation by stimulated generation of plasmons in a planar array of graphene microcavities <u>O.V. Polischuk</u><sup>1</sup>,<sup>2</sup>, V.V. Popov<sup>1,2</sup>, A. Davoy-an<sup>1</sup>, V. Ryzhii<sup>3</sup>, T. Otsuji<sup>3</sup>, M.S. Shur<sup>4</sup>; <sup>1</sup>Kotelnikov Institute (Saratov Branch), Russian

Academy of Sciences (RU), <sup>2</sup>Saratov State University (RU), 3Research Institute for Electrical Communication, Tohoku University (JP) <sup>4</sup>Department of Electrical, Computer, and Systems Engineering, Rensselaer Polytechnic Institute (US)

We consider the amplification of THz wave by stimulated generation of resonant plasmons in a planar periodic array of graphene plasmonic microcavities in a selfconsistent electromagnetic approach. The amplification of THz wave enhances by several orders of the magnitude at the plasmon resonance frequencies.....Pg. 709

# TOM3\_6179\_049

Three-dimensional photonic crystal for light beam collimation

M. Peckus1, L. Maigyte2, J. Trull2, V. Mizeikis<sup>3</sup>, M. Malinauskas<sup>4</sup>, S. Juodkazis<sup>5</sup>, C. M. Cojocaru<sup>2</sup>, M. Rutkauskas<sup>4</sup>, V. Sirutkaitis<sup>4</sup>, K. Staliunas<sup>2,6</sup>; <sup>1</sup>Center for Physical Sciences and Technology (LT), <sup>2</sup>Departament de Física i Enginyeria Nuclear, Universitat Politècnica de Catalunya (ES), <sup>3</sup>Division of Global Research Leaders (Research Institute of Electronics) Shizuoka University (JP), 4Laser Research Center, Dep. of Quantum Electronics, Vilnius University (LT), <sup>5</sup>Swinburne University of Technology, Centre for Micro-Photonics (H38) (AU), <sup>6</sup>Institució Catalana de Reserca i Estudis Avançats (ICREA) (ES).

We report and analyze experimental observation of the formation of a narrow, well collimated laser beam behind the woodpile photonic crystal. We show that the collimation depends on the input laser beam focusing conditions and discuss the experimental results.....Pg. 711

### TOM3 6183 050

Negative-index metamaterials in real world: light self-collimation, solar cells and phase sensitive SPR ellipsometry

V. Mocella<sup>1</sup>, P. Dardano<sup>1</sup>, S. Romano<sup>1</sup>, E. De Tommasi<sup>1</sup>, A.C. De Luca<sup>2</sup>, I. Rendina<sup>1</sup>, S. Cabrini<sup>3</sup>; <sup>1</sup>National Council for Research, Institute for Microelectronics and Microsystems (IT), <sup>2</sup>National Council for Research. Institute for the Biochemistry of Proteins (IT), <sup>3</sup>Molecular Foundry, Lawrence Berkeley National Laboratory (US).

We illustrate our applications of photonic crystal based metamaterials: the large scale light propagation without diffraction, the light trapping for solar cells and the enhancement of the classical SPR, using a phase-ellipsometry technique without prism or grating coupling.....Pg. 713

NOTES

### TOM 4 POSTER SESSION I

### WEDNESDAY, 26 September 13:00 - 15:10

### TOM4\_5811\_003 Liquid Crystal Optical Control for Solution Production Industries

S.K. Stafeev, M.G. Tomilin, A.A. Zinchik; St.-Petersburg University of Information Technologies, Mechanics and Optics, Physics Department (RU).

The solution properties study is important problem in medicine, biology, chemistry, security, beverage foods. In many cases the structure homogeneity of solid components determines solution characteristics. For detecting solution production quality control of solid components structure with liquid crystals (LCs) is suggested.....Pg. 719

### TOM4\_5791\_001 Pulse repetition interval-based excess fraction (PRIEF) method and its measurement accuracy

D. Wei<sup>1</sup>, H. Matsumoto<sup>2</sup>; <sup>1</sup>Global Centers of Excellence Program for Mechanical Systems Innovation, School of Engineering, the University of Tokyo (JP); <sup>2</sup>Department of Precision Engineering, the University of Tokyo (JP). A novel approach for an analysis of the measurement accuracy of the pulse repetition interval-based excess fraction (PRIEF) method is proposed. The proposed approach is introduced by focusing on an analogy between the PRIEF method and the conventional length-measurement methods, which are white-light method and excess fraction method. The result of the analysis will be presented.....Pg. 715

### TOM4\_5792\_002 Application of multi pulse trains interference to observation of atmospheric turbulence over meter order

D. Wei<sup>1</sup>, H. Matsumoto<sup>2</sup>; <sup>1</sup>Global Centers of Excellence Program for Mechanical Systems Innovation, School of Engineering, the University of Tokyo (JP); <sup>2</sup>Department of Precision Engineering, the University of Tokyo (JP). A novel interferometric technique using multi pulse trains interference is developed to observe the atmospheric turbulence over 1.5 meter and 3 meter. The measured distribution of the atmospheric turbulence over 3 meter was compared to that of 1.5 meter to decide the achievement of steady state of the temperature of air over 3 meter. This technique can be used to decide the stability of the temperature of air over a long distance.....Pg. 717

### TOM4\_5812\_004 **STUDENT PRESENTATION** The method of determining the average size of the inhomogeneities in nanoporous glasses <u>D.N. Vavulin</u>, A.V. Alfimov, A.V. Panteleev,

E.M. Aryslanova, S.A. Chivilikhin; Saint-Petersburg State University of Informational Technologies, Mechanics and Optics, Department of Photonics and Optoinformatics (RU). In this paper, we propose a method for determining the size of nanoscale inhomogeneities in scattering and absorbing medium by comparing the theoretical and experimental dependences of the transmission medium on different wavelength of the light. The method was tested on a sample of nanoporous glass....Pg. 720

### TOM4\_5841\_007 STUDENT PRESENTATION Enhancement of Luminescence with Resonance Waveguide Grating

<u>A. Partanen</u><sup>1</sup>, I. Koshevoy<sup>2</sup>, T. Saastamoinen<sup>1</sup>, J. Mutanen<sup>1</sup>, H. Lajunen<sup>1</sup>, M. Kuittinen<sup>1</sup>; <sup>1</sup>University of Eastern Finland, Department of Physics and Mathematics (FI), <sup>2</sup>University of Eastern Finland, Department of Chemistry (FI).

In this study two resonance waveguide gratings with different structures were designed to enhance luminescence effect. The optimization and the fabrication steps of the gratings are described. The theoretical enhancement of the energy densities inside the luminescent material are 1100- and 360-fold for the two gratings....Pg. 726

### TOM4\_6162\_010 Wideband resonance reflectors in the visible spectrum

<u>T. Saastamoinen</u>, M. Surakka, M. Kuittinen; University of Eastern Finland, Department of Physics and Mathematics (FI).

We present wideband resonance waveguide reflectors providing nearly 100% reflectance over a range of several tens of nanometres at the visible wavelengths. The reflectors are based on multilayer design consisting of layers of high and low index materials with a binary grating etched through the stack.....Pg. 732

### TOM4\_5825\_005 STUDENT PRESENTATION Optical characterization of thin films nonuniform in thickness using multi-sample method of imaging spectroscopic reflectometry

<u>D. Nečas</u><sup>1,2</sup>, I. Ohlídal<sup>2</sup>, D. Franta<sup>1,2</sup>, M. Ohlídal<sup>9</sup>, J. Vodák<sup>3</sup>, P. Nádaský<sup>3</sup>; <sup>1</sup>Masaryk University, CEITEC, Plasma Technologies (CZ), <sup>2</sup>Masaryk University, Faculty of Science, Department of Physical electronics (CZ), <sup>3</sup>Brno University of Technology, Faculty of Mechanical Engineering, Institute of Physical Engineering (CZ).

Within imaging spectroscopic reflectometry, the simultaneous treatment of local spectral reflectances in individual pixels of a CCD camera serving as the detector of a selfmade two-channel spectrophotometer allows determining the optical constants and local thickness distribution of thin films exhibiting thickness area non-uniformity.....Pg. 722

### TOM4\_5838\_006

### Realization of Bessel Beams Using Diffractive Chrome Structures

<u>G. Ehret</u>, B. Andreas; Physikalisch-Technische Bundesanstalt (DE).

Bessel beams, which are mathematical solutions of the Helmholtz equation, are "nondiffracting" optical beams. In practice only approximations of these beams can be realized. With two different methods we modelled the generation and propagation of real beams and compared the results with corresponding experiments.....Pg. 724

### NOTES

### TOM4\_5852\_008 STUDENT PRESENTATION Direct laser fabrication of diffractive optical elements in fused silica

<u>M. Pfeifer</u>, F. Jahn, S. Weissmantel, B. Steiger; University of Applied Sciences Mittweida (DE).

Results of our investigations on direct laser fabrication of diffractive optical elements (DOE's) in fused silica by mask projection technology using a fluorine laser will be presented. In particular, it will be shown that DOE's for the shaping of laser beams can be produced.....Pg. 728

# TOM4\_5859\_009

# Polarimetric imaging via compressive sampling

<u>V. Durán</u><sup>1,2</sup>, P. Clemente<sup>1,3</sup>, M. Fernández<sup>1,2</sup>, E. Tajahuerce<sup>1,2</sup>, J. Lancis<sup>1,2</sup>, P. Andrés<sup>4</sup>; <sup>1</sup>I-NIT, Universitat Jaume I (ES); <sup>2</sup>GROC•UJI, Departament de Física, Universitat Jaume I (ES), <sup>3</sup>SCIC, Universitat Jaume I (ES), <sup>4</sup>Departamento de Óptica, Universitat de València (ES).

We present an optical system that exploits a commercial (non-pixelated) polarimeter to perform spatially resolved measurements of the Stokes parameters of light. This fact is possible by applying the theory of compressive sampling to the data collected by the polarimeter. A proof of concept is demonstrated with the aid of a polarization object that generates an inhomogeneous polarization distribution....Pg. 730

### TOM4\_5913\_011

Photochromic recording on nitrogen vacancy centres in nanodiamond-dispersed photopolymers

<u>J. Storteboom</u>, X. Li, M. Gu; Centre for Micro -Photonics, Faculty of Engineering and Industrial Sciences, Swinburne University of Technology (AU).

We report on the optical recording using the photochromism of nitrogen vacancy (NV) centres in nanodiamond-dispersed photopolymers. Intense laser irradiation induced conversion between negative and neutral charge states of NV centres is observed. Application of this photochromism in optical memory is demonstrated.....Pg. 734

### TOM 4 POSTER SESSION II

### TOM4\_5814\_012

Laser 3D Internal machining of polymers <u>F. Rey-García</u><sup>1</sup>, C. Bao<sup>1</sup>, C. Gómez-Reino<sup>1</sup>, G.F. De La Fuente<sup>2</sup>; <sup>1</sup>University of Santiago of Compostela, Dpto. Física Aplicada, UA Microóptica & Óptica GRIN (ES); <sup>2</sup>Instituto de Ciencia de Materiales de Aragón (ICMA-CSIC), Laboratorio de Aplicaciones del Láser (ES).

The Laser Backwriting process was employed for the internal tri-dimensional machining of polymeric plates of polycarbonate (PC) and polyethyleneterefthalate (PET) immersed in water. A Nd:YVO4 laser emitting nanopulses at fundamental wavelength (1064 nm) was employed....Pg. 736

### TOM4\_5887\_014 Holographic anisotropy of molecular glassy films

<u>A. Ozols</u>, V. Kokars, P. Augustovs, K. Traskovskis, D. Saharov; Riga Technical University, Faculty of Material Science and Applied Chemistry (LV).

Photoinduced anisotropy is experimentally studied in three molecular glassy films synthesized in our Faculty and containing diphenylamine based azochromophores in comparison with an chalcogenide a-As<sub>2</sub>S<sub>3</sub> film. Novel holographic method was applied in both transmission and reflection modes. Pa. 738

### TOM4\_5943\_016 STUDENT PRESENTATION Spectral Response for Optical Biosensor

Based on Intrinsic Fabry-Pérot Cavity <u>C. Benmouhoub</u><sup>1,2</sup>, A. Zegadi<sup>2</sup>, G. Ulliac<sup>1</sup>, K. Ghoumid<sup>1,3</sup>, T. Gharbi<sup>1</sup>; <sup>1</sup>Franche-Comté University, LOPMD Department (FR); <sup>2</sup>Ferhat Abbas University, Electronic Department (DZ); <sup>3</sup>National School of Applied Sciences (MA).

In the present work, we propose a prototype biosensor, using a Fabry-Pérot (FP) cavity as basic configuration. The integrated optical structure is sensitive to refractive index change induced due to the interaction of the evanescent field with a biological specimen placed inside the FP cavity.....Pg. 740

### TOM4\_5965\_017

### Manufacturing of Freeform Mirror by Milling and Enhancing its UV/VIS Characteristics by ALD SiO<sub>2</sub> Coating

<u>J. Mutanen</u><sup>1</sup>, S. Kivi<sup>2</sup>, J. Väyrynen<sup>3</sup>, M. Toiviainen<sup>2</sup>, A. Partanen<sup>1</sup>, J. Laukkanen<sup>1</sup>, V. Prokofiev<sup>1</sup>, P. Pääkkönen<sup>3</sup>, M. Juuti<sup>2</sup>, M. Kuittinen<sup>1</sup>, K. Mönkkönen<sup>3</sup>; <sup>1</sup>University of Eastern Finland, Department of Physics and Mathematics (FI); <sup>2</sup>VTT Technical Research Centre of Finland (FI); <sup>3</sup>North Karelia University of Applied Sciences (FI).

In this study two aluminium and brass freeform mirrors from CNC pre-machined molds were micro-milled by ultra precision diamond machine tool and ALD SiO<sub>2</sub> coatings added to enhance the optical characteristics of the mirrors in UV/VIS region. The optical characterists of the mirrors and function of the mirror system were tested.....Pg. 742

### TOM4\_6029\_018

### Electro-optically tunable waveguide Bragg gratings in Lithium Niobate integrated by femtosecond laser pulses

<u>W. Horn</u>, S. Kroesen, C. Denz; Institute of Applied Physics & Center for Nonlinear Science, University of Muenster (DE). We demonstrate the fabrication of electrooptically tunable, type-II Bragg gratings in Lith-ium Niobate wafers. The waveguide is structured periodically to achieve narrowband reflections in the c-band. An electric field is used to achieve electro-optic tuning of the reflection maximum by  $\Delta \lambda = 625$  pm. Pg. 744

### TOM4\_6035\_019 Modeling surface profiles of arbitrary initial shape in reflow process

<u>R. Kasztelanic</u><sup>1</sup>, M. Barański<sup>1,2</sup>; <sup>1</sup>University of Warsaw, Faculty of Physics (PL); <sup>2</sup>UFR Sciences et Techniques, Institute FEMTO-ST (FR). We present a finite-element method to calculate 3D surface profiles of microelements fabricated in the melting-resist technology (reflow process). The initial geometry of the microelements in the reflow process can be arbitrary. So, our model takes into account temperature distribution, viscosity, surface tension and gravity....Pg. 746

### TOM4\_6089\_020 Evaluation of scatterometry for characterisation of hybrid optics

A. Lassila<sup>1</sup>, <u>B. Bodermann</u><sup>2</sup>, J. Turunen<sup>3</sup>, P.-E. Hansen<sup>4</sup>, M. Wurn<sup>2</sup>, S. Siitonen<sup>5</sup>, T. Saastamoinen<sup>3</sup>, H. Husu<sup>1</sup>, V. Korpelainen<sup>1</sup>; <sup>1</sup>Mittatekniikan Keskus (Fl); <sup>2</sup>Physikalisch-Technische Bundesanstalt (DE); <sup>3</sup>University of Eastern Finland (Fl); <sup>4</sup>Dansk Fundamental Metrolog (DK); <sup>5</sup>Nanocomp Oy Ltd (Fl). Within a European joint research project it is aimed to develop fast and simple methods based on scatterometry for process development and quality control of both diffractive and diffractive-refractive optics in industrial environments. We describe the status and the intended goals of this project and present first results....Pg. 748

### TOM4\_6093\_021 STUDENT PRESENTATION Embedding grating mirror in resonant cavityenhanced absorber structures for midinfrared detectors applications

M. Zohar<sup>1,2</sup>, M. Auslender<sup>1</sup>, S. Hava<sup>1</sup>, L. Faraone<sup>3</sup>; <sup>1</sup>Ben-Gurion University of the Negev, Department of Electrical and Computer Engineering (IL); <sup>2</sup>Sami Shamoon College of Engineering, Department of Electrical and Electronics Engineering (IL); <sup>3</sup>The University of Western Australia, School of Electrical, Electronic and Computer Engineering (AU). One grating mirror structure is considered for a dielectric Fabry-Perot cavity to enhance the optical absorption in a thin semiconductor layer embedded within the resonant cavity. In this design, the front mirror is a grating structure which acts as a nearly perfect retroreflection and the back mirror is quarter-wave stack.....Pg. 750

### THURSDAY, 27 September 12:45-15:00

### TOM4\_6113\_022 Microlens Arrays for Single Photon Ava-

lanche Diodes within the MiSPIA Project A.J. Waddie<sup>1</sup>, A. McCarthy<sup>1</sup>, S. Tisa<sup>2</sup>, S. Bellisai<sup>3</sup>, G.S. Buller<sup>1</sup>, M.R. Taghizadeh<sup>1</sup>; <sup>1</sup>Institute of Photonic and Quantum Sciences, School of Engineering and Physical Science, Heriot-Watt University (GB); <sup>2</sup>Micro Photon Devices (IT): <sup>3</sup>Dipartimento di Elettronica e Informazione, Politecnico di Milano (IT). Single photon avalanche diodes (SPADs) are optoelectronics devices capable of producing measureable photocurrent from the incidence of a single photon. In this paper, we investigate the improvements in light gathering efficiency that can be gained by the placement of a large fill-factor microlens array on top of a customised SPAD array. A preliminary tolerance analysis of the lens array reveals that the improvements in light gathering efficiency are relatively insensitive to both placement accuracy and incident wavelength.....Pg. 752

Development of ZnO-polystyrene nanocomposite suitable for the preparation of plastic distributed Bragg reflectors (DBR) P. Lova<sup>1</sup>, L. Boarino<sup>2</sup>, D. Antonioli<sup>3</sup>, M. Laus<sup>3</sup>, G. Urbinati<sup>4</sup>, T. Losco<sup>4</sup>, M.C. Ungureanu<sup>4</sup>, V. Caratto<sup>1,5</sup>, M. Ferretti<sup>1,5</sup>, F. Marabelli<sup>4</sup>, D. Comoretto<sup>1</sup>; <sup>1</sup>Università degli Studi di Genova, Dipartimento di Chimica e Chimica Industriale (IT), <sup>2</sup>Istituto Nazionale di Ricerca Metrologica (INRIM) (IT), <sup>3</sup>Università del Piemonte Orientale, Dipartimento di Scienze della Vita (IT), <sup>4</sup>Università degli Studi di Pavia, Dipartimento di Fisica "A. Volta" (IT),

<sup>5</sup>CNR-SPIN (IT). We report on the preparation of polystyrene (PS) matrices loaded by ZnO nanoparticles (NP) synthetized by solvothermal reaction. The refractive index of loaded matrices is increased with respect to that of bare polystyrene without affecting its processability. Good optical quality polymer DBR have been indeed prepared by spin coating. Pa. 756

TOM5\_6129\_002 STUDENT PRESENTATION All-Organic Photonic Crystal Gate Dielectric with High Extraction Efficiency into OLET M. Natali<sup>1</sup>, S. Toffanin<sup>1</sup>, S. Cavallini<sup>1</sup>, F. Scotognella<sup>2</sup>, M. Muccini<sup>1,3</sup>; <sup>1</sup>Institute for Nanostructured Materials (ISMN), National Research Council (IT), <sup>2</sup>Department of Physics, Politecnico di Milano (IT), <sup>3</sup>E.T.C. srl (IT). We report the implementation of functionalized gate dielectric in OLET devices. Pg. 758

### WEDNESDAY, 26 September 13:00 - 15:10

TOM5\_6198\_003 STUDENT PRE Controlling Morphology of Polymer: Polymer Blends for Solar Cells Using Nanowire Formation and Molecular Weight Variation S. Wood<sup>1</sup>, J.S. Kim<sup>1</sup>, D.T. James<sup>1</sup>, C. Wing Tsoi<sup>1</sup>, C.E. Murphy<sup>2</sup>, J.-S. Kim<sup>1</sup>; <sup>1</sup>Department of Physics and Centre for Plastic Electronics, Imperial College London (GB), <sup>2</sup>National Physical Laboratory (NPL) (GB). The relationship between thin film morphology and photovoltaic device performance of polymer:polymer blends is investigated. We find that the photocurrent is limited by optical and charge transport properties of the blend layer inducing geminate and nongeminate loss mechanisms, which can be reduced by morphological control.....Pg. 760

### POSTER SESSION II TOM 5

### TOM5\_5874\_005

1D polymer photonic crystals doped with photochromic materials: optical characterization

L. Occhi<sup>1</sup>, C. Toccafondi<sup>2</sup>, R. Castagna<sup>3,4</sup>, C. Bertarelli<sup>3,4</sup>, M. Canepa<sup>2</sup>, <u>D. Comoretto<sup>1</sup></u>; <sup>1</sup>Università di Genova, Dip23,4 artimento di Chimica e Chimica Industriale (IT), <sup>2</sup>Università di Genova, CNISM and Dipartimento di Fisica (IT), <sup>3</sup>Politecnico di Milano, Dipartimento di Chimica, Materiali e Ingegneria Chimica "G. Natta" (IT), 4 Istituto Italiano di Tecnologia, Center for Nano Science and Technology@PoliMi (IT). We report on the optical characterization of diarylethene-based photochromic polyester (p-dae). Its complex refractive index is determined by ellipsometry during the isomerization process. Polymer Distributed Bragg Reflectors and microcavities doped with pdae are prepared by spin-coating and optical characterized.....Pg. 762

### TOM5\_5863\_006 STUDENT PRESENTATION Bis-Pyrrolyl Benzo[1,2,5]Thiadiazole Based Alternating Polymers for Application in Solar Cells

M. Almeataq, A. Iraqi; Department of Chemistry, University of Sheffield (GB). Low energy gap alternating copolymers comprising bis-pyrrolyl benzo[1,2,5]thiadiazole and carbazole or fluorene repeat units have been prepared successfully for use as electron donors in bulk heterojunction solar cells using PCBM as an acceptor. The photophysical and electrochemical properties of these copolymers are presented. Pg. 764

### THURSDAY, 27 September 12:45 - 15:00

### TOM 6 POSTER SESSION I

### TOM6\_5822\_001

### Spatial dispersion and spatiotemporal solitons in cubic-quintic optical waveguides

R. Cowey, G. Lancaster, J.M. Christian, G.S. McDonald; University of Salford, Materials & Physics Research Centre (GB). We report on fresh developments in the field of spatiotemporal optical solitons. A host of new analytical and numerical predictions for light pulses in nonlinear waveguides will be detailed, which have a simple physi-

cal interpretation. Tantalizing connections to Einstein's special relativity theory have also been uncovered.....Pg. 766

### TOM6\_5824\_002 Helmholtz dark spatial optical solitons for a defocusing saturable nonlinearity

M.J. Lundie<sup>1</sup>, J.M. Christian<sup>1</sup>, G.S. McDonald<sup>1</sup>, P. Chamorro-Posada<sup>2</sup>; <sup>1</sup>University of Salford, Materials & Physics Research Centre (GB), <sup>2</sup>Universidad de Valladolid, ETSI Telecomunicación (ES).

We report on our latest developments in the field of Helmholtz soliton theory: the derivation of exact dark spatial optical solitons for a defocusing saturable nonlinearity. A raft of new physical predictions is made, and extensive analysis (via both mathematical and computational methods) investigates solution properties.....Pg. 768

# TOM6\_5872\_003

### Spatiotemporal Soliton Formation in Coupled Arrays of SOI Waveguides

O.K. Staines, A.V. Gorbach, G.D. Hobbs, D.V. Skryabin, W.J. Wadsworth, J.C. Knight; Centre for Photonics and Photonic Materials. Department of Physics, University of Bath (GB).

We present theoretical studies of spatiotemporal solitons ("light bullets") in coupled silicon nanowaveguide arrays conducted at pump wavelengths greater than 2µm where two-photon absorption effects in silicon are substantially reduced.....Pg. 770

### TOM6\_5984\_005 STUDENT PRESENTATION Optimization of nonlinear swift-heavy ion irradiation waveguides against propagation

losses and photorefractive optical damage M. Jubera<sup>1</sup>, J. Villarroel<sup>1</sup>, A. García-Cabañes<sup>1</sup>, J.Olivares<sup>2,3</sup>, M. Carrascosa<sup>1</sup>; <sup>1</sup>Universidad Autónoma de Madrid, Dept. Física de Materiales (ES), <sup>2</sup>CMAM, Universidad Autónoma de Madrid (ES), <sup>3</sup>Instituto de Optica, CSIC (ES),

Recent work to reduce propagation losses and to characterize and control photorefractive damage in novel shift-heavy LiNbO3 ion irradiation waveguides is reported. Propagation losses lower than 0.5 dB/cm has been achieved. Photorefractive damage has been characterized and significantly reduced by heating up to 75°C.....Pg. 772

### TOM6\_6059\_006

### Two-centre model applied to photorefractive beam degradation in LiNbO3 planar waveguides

<u>A. Alcázar</u><sup>1</sup>, J. B. Ramiro<sup>1</sup>, A. Méndez<sup>1</sup>, J. Villarroel<sup>2</sup>, A. García-Cabañes<sup>2</sup>, M. Carrascosa<sup>2</sup>; <sup>1</sup>Universidad Politecnica de Madrid, Dept. Aerotecnia (ES), 2 Universidad Autonoma de Madrid, Dept. Fisica de Materiales (ES).

Photorefractive beam degradation in LiNbO3 planar waveguides has been investiaated through a nonlinear beam propagation method. The simulations use a two-centre model (Fe<sup>2+</sup>/Fe<sup>3+</sup> and Nb<sub>Li</sub><sup>4+</sup>/Nb<sub>Li</sub><sup>5+</sup>). The obtained results help to explain the variety of recent experimental data including selfdefocusing and filamentation.....Pg. 774

### TOM6\_6141\_007 Photovoltaic current in nanoparticles of lithium niobate

J.B. Ramiro, A. Méndez, <u>A. Alcázar</u>; Universidad Politécnica de Madrid, Depto Aerotecnia (FS)

Photovoltaic current in lithium niobate nanoparticles has been analized by Monte Carlo simulations. The role of particle size, geometry and Fe doping has been investigated and possible biological implications are discussed.....Pg. 776

### TOM6\_6076\_008 STUDENT PRESENTATION Investigation of TM Surface Guided Modes in a Cylindrical Metal Clad Nano-Structure Laser

Z. Abdul Sattar, K.A. Shore; Bangor University, School of Electronic Engineering (GB). We investigate properties of TM surface guided modes in a cylindrical metal clad nano-structure. A multi-layered geometry is utilized to determine the effect of gain variation on TM surface guided modes. Pg. 778

### TOM6\_6163\_009

Spatial emission structures in vertical-cavity surface-emitting lasers with feedback from a volume Bragg grating

T. Ackemann, Y. Noblet; SUPA and University of Strathclyde, Physics department (GB). We investigate the spatial properties of broad-area vertical-cavity surface-emitting lasers with frequency-selective feedback by a volume Bragg grating. Length scales and shapes of patterns are analyzed quantitatively. It is also addressed how deviations from the self-imaging condition affect the pattern formation.....Pg. 780

### WEDNESDAY, 26 September 13:00 - 15:10

### TOM6\_6430\_020 Post deadline sub First complete phase-matching study of the Langatate LGT

E. Boursier, <u>P. Segonds</u>, B. Boulanger, B. Ménaert, J. Debray; Institut Néel CNRS Université Joseph Fourier (FR). We identified the piezoelectric crystal La3Ga5.5Ta0.5O14 (LGT) as a new material for nonlinear optics from 0.5  $\mu m$  to 6.5 µm. We performed the first complete theoretical and experimental study of quadratic sum- and differencefrequency generations The simultaneous fit of angular data allow the Sellmeier equations to be refined over the entire transparency range. Efficiencies measurements will lead to the determination of the non linear coefficient.....Pg. 782

### Post deadline subr TOM6\_6426\_021 Wigner flow reveals topological features of quantum dynamics

O. Stevernagel, D. Kakofengitis, G. Ritter; School of Physics, Astronomy, and Mathematics, University of Hertfordshire (GB). In augntum dynamics traditionally the evolution of wave functions, say Wigner's function, is studied. We identify the flow that is the quantum analog of classical Liouville flow. It reveals new features of quantum dynamics, extra complexity, introduces topological order into quantum dynamics and shows similarities with singular optics.....Pg. 784

TOM6\_5850\_010

### TOM 6 POSTER SESSION II

### STUDENT PRESENTATION TOM6\_5905\_014

Probing the Mechanism of Green Emission in ZnO Nanowires by Ultrafast Spectroscopy M. Li, G. Xing, T.C. Sum; Division of Physics & Applied Physics, School of Physical & Mathematical Sciences, Nanyang Technological University (SG).

The nature of the green emission (GE) centers, recombination mechanism and interband hole-trapping to the GE-centers in ZnO nanowires have been extensively studied by various ultrafast spectroscopies.....Pg. 786

### TOM6 5851 011 STUDENT PRESENTATION Optimal nanofiber dimensions for stimulated Raman scattering in the evanescent field

L. Shan<sup>1</sup>, G. Pauliat<sup>1</sup>, L. Tong<sup>2</sup>, S. Lebrun<sup>1</sup>; <sup>1</sup>Laboratoire Charles Fabry, Institut d'Optique, CNRS, Université Paris-Sud (FR), <sup>2</sup>State Key Lab of Modern Optical Instrumentation, Department of Optical Engineering, Zhejiang University (CN).

In nanofibers, the guided mode presents a strong evanescent field. We investigate the Raman interaction between this field and a liquid surrounding the nanofiber. Our modeling demonstrates that the Raman conversion is obtained with nanofiber lengths an order of magnitude lower than for liquid core photonic crystal fibers.....Pg. 788

### TOM6\_5853\_012

### Quasi-soliton formation in silicon nanowires with engineered dispersion profile

D.C. Zografopoulos<sup>1</sup>, R. Beccherelli<sup>1</sup>, E.E. Kriezis<sup>2</sup>; <sup>1</sup>Consiglio Nazionale delle Ricerche, Istituto per la Microelettronica e Microsistemi (CNR-IMM) (IT), <sup>2</sup>Department of Electrical and Computer Engineering, Aristotle University of Thessaloniki (GR).

Soliton-like propagation of fs pulses in dispersion-engineered silicon photonic wires is theoretically investigated. Quasi-soliton propagation is demonstrated for 100-fs pulses over large propagation lengths for a realistic patterned silicon wire of optimally engineered group-velocity dispersion (GVD) profile.....Pg. 790

### NOTES

# Pyroelectrically induced 2D waveguide

channels and 1D photonic lattices in lithium niobate: some features and light self-action A. Parkhanyuk<sup>1</sup>, A. Markin<sup>1</sup>, D. Kortushanov<sup>1</sup>, V. Shandarov<sup>1</sup>, F. Chen<sup>2</sup>; <sup>1</sup>State University of Control Systems and Radioelectronics (RU), <sup>2</sup>School of Physics, Shandong University (CN). Both, two-dimensional waveguide channels and one-dimensional photonic lattices are optically induced in lithium niobate exploiting the contribution of pyroelectric effect. The discrete diffraction of light beams and the storage time of these waveguide structures within the crystal bulk are experimentally investigated.....Pg. 792

### TOM6\_5942\_015 Formation of spatially localized selftrapping light structures in Plexiglas-based photopolymers

<u>E. Tolstik<sup>1</sup></u>, O. Romanov<sup>2</sup>, V. Matusevich<sup>1</sup>, A. Tolstik<sup>2</sup>, R. Kowarschik<sup>1</sup>; <sup>1</sup>Friedrich Schiller University, Institute of Applied Optics (DE), <sup>2</sup>Belarusian State University, Physical Department (BY).

The possibility of the generation of light selftrapping structures in polymeric media based on polymethylmethacrylate (PMMA) with homogenously distributed photosensitive phenanthrenequinone (PQ)-molecules is predicted theoretically and examined experimentally by applying laser sources in the blue-green spectral range.....Pg. 794

### TOM6 6007 016 STUDENT PRESENTATION Numerical stability analysis of solitary waves in one- and two-dimensional periodic structures

A. Savickas<sup>1</sup>, E. Gaižauskas<sup>1</sup>, K. Staliūnas<sup>2</sup>; <sup>1</sup>Vilnius University, Laser Research Center (LT), <sup>2</sup>Universitat Politecnica de Catalunya, Departament de Fisica i Enginyeria Nuclear (ES).

One-dimensional band gap soliton instability was numerically investigated at the middle of the band app due to four wave mixing. Soliton instability was analized both in the frame of microscopic model, and quasisoliton with its shadow. One-dimensional case was compared with bessel lattices in two dimensions.....Pg. 796

### THURSDAY, 27 September 12:45 - 15:00

### TOM6\_6030\_017

Simplified architectures with homodyne detection for high capacity Lippmann data storage

G. Pauliat; Laboratoire Charles Fabry, Institut d'Optique, CNRS, Université Paris-Sud (FR).

Lippmann interference architectures are alternatives to holographic memories for high capacity data storage. We propose a homodyne scheme for these systems, which simplifies their use.....Pg. 798

### TOM6 6120 018 STUDENT PRESENTATION Energy Shedding during Nonlinear Focusing of Gaussian Beams

C. Travis<sup>1</sup>, G.L. Oppo<sup>1</sup>, G. Norris<sup>2</sup>, G. McConnell<sup>2</sup>; <sup>1</sup>University of Strathclyde, Department of Physics (GB), <sup>2</sup>University of Strathclyde, SIPBS (GB).

Self focusing of intense Gaussian beams of light in nonlinear media is accompanied by the shedding of energy as the beam undergoes reshaping. Using the Nonlinear Schrödinger equation, a comparison of the energy shedding in media with cubic and saturating nonlinearities is presented for both continuous wave and pulsed input. Pa. 800

### TOM6\_6197\_019 DWDM Distribution of Photon Pairs Produced by Sponaneous Parametric Down

Conversion J. Ghalbouni, I. Agha, E. Diamanti, R. Frey, I. Zaquine; Institut Télécom/Télécom Pa-

ristech, CNRS-LTCI (FR). We have experimentally implemented the distribution of photon pairs through a telecom DWDM filter. Using the measured counts and coincidences between symmetric channels, the maximum fringe visibility that can be obtained with polarization entangled photons is evaluated.....Pg. 802

### TOM 7 POSTER SESSION I

TOM7\_5832\_001 Surface shape reconstruction of located small object

E.V. Buryi; Bauman Moscow State Technical University, Laboratory of laser information system (RU).

The reconstruction method of surface remote small object based on multiposition registration of long range portraits was proposed. Pg. 804

### TOM7 5856 002 STUDENT PRESENTATION Real-time lock-in threshold tracking of ring laser gyro

Z. Fan, H. Luo, G. Lu, S. Hu; College of Optoelectronic Science and Engineering, National University of Defense Technology (CN). By evaluating the lost information in the lockin traverse moment, a new lock-in threshold measurement method for mechanically dithered ring laser gyro (RLG) is proposed. This method, which is based on Kalman filter, can evaluate the lock-in threshold and its variation real-time in working condition with mechanical dither.....Pg. 806

### TOM7\_6014\_003 Time resolved Imaging of a vibrating clari-

net reed by Sideband Digital Holography F. Verpillat<sup>1</sup>, M. Atlan<sup>2</sup>, F. Joud<sup>1</sup>, <u>M. Gross<sup>3</sup></u>; <sup>1</sup>Laboratoire Kastler Brossel, ENS, UPMC-Paris6, CNRS UMR 8552 (FR), <sup>2</sup>Institut Langevin, ESPCI ParisTech, CNRS UMR 7587 (FR), <sup>3</sup>Laboratoire Charles Coulomb, CNRS UMR 5221, Université Montpellier II (FR). We reconstruct the instantaneous velocities maps of a vibrating clarinet reed by combining Sideband Digital Holography with stroboscopic illumination synchronized with the vibration motion.....Pg. 808

### TOM7\_6064\_004 Pilot model of submersible camera for plankton digital holography

V.V. Dyomin, I.G. Polovtsev, A.S. Olshukov, D.V. Kamenev; Tomsk State University, Radiophysics Department (RU). Pilot model of submersible holographic camera is presented which is designed for digital holographing the plankton in habitat. Optical scheme, camera-control unit, and system for data transmission to ocean surface are founded. Preliminary experimental results on plankton holographing are presented. Pg. 810

### WEDNESDAY, 26 September 13:00 - 15:10

### TOM7\_6151\_005 Raman Spectroscopy for Process Monitoring

in the Energy and Production Industry F.M. Zehentbauer, H. Struthers, E.J. Bain,

J. Kiefer; University of Aberdeen, School of Engineering (GB). The use of Raman spectroscopy for process

monitoring is demonstrated in a direct methanol fuel cell and a distillation column. The spectroscopic method provides a tool for chemical composition measurements with high accuracy and precision. In the fuel cell, a simultaneous electrochemical analysis allows multiple parameter monitoring.....Pg. 811

NOTES

### TOM 7 POSTER SESSION II

### TOM7\_5833\_006 STUDENT PRESENTATION Reconstruction of 3D-scenes with means of registered long-range portraits

P.V. Arakcheev, E.V. Buryi, A.S. Maryanina, D.A. Semerenko; Bauman Moscow State Technical University, Laboratory of Laser Information System (RU).

The reconstruction method of object and underlying surface of located volume part was suggested. The method is based on analysis of long-range portraits obtained during slow scanning of the located volume with knife-edge laser beam in two mutually

perpendicular directions.....Pg. 813

### TOM7 5834 007

### Contour reconstruction of located object with parameters of 4<sup>th</sup> order correlation function of laser radiation scattered field registered with matrix photodetector

P.V. Arakcheev, D.A. Semerenko, A.S. Maryanina, S.I. Nazarov, E.V. Buryi; Bauman Moscow State Technical University, Laboratory of Laser Information System (RU). The method of contour reconstruction of located object was proposed and investigated using a physical model. This method is based on estimation of object angular dimensions using parameters of 4th order correlation function of radiation field.....Pg. 815

### TOM7\_5879\_008 Mirror movements-induced equivalent rotation effect in ring laser gyros

G. Lu, H. Luo, Z. Fan, S. Hu, Y. Huang, J. Tang; Department of Optoelectronic Engineering, College of Optoelectrics Science and Engineering, National, University of Defense Technology (CN).

In this letter, equivalent rotation effect induced by mirrors' movements in ring laser gyros is investigated. When one spherical mirror is pushed forward and the other is pulled backward, an equivalent rotation of the closed-loop optical path is induced. The equivalent rotation rate is proportional to the velocities of the mirrors' movements. Pg. 817

### TOM7 6205 009

### **Optical Fibre Based Multiparameter Sensing** For Subsea Applications

R. Pawar<sup>1</sup>, <u>R. Prabhu<sup>2</sup></u>; <sup>1</sup>School of Engineering, Robert Gordon University (GB), <sup>2</sup>IDeaS Research Institute, Robert Gordon University (GB).

Use of optical fibres for multiparameter sensing in subsea applications has been investigated. The sensing approach is based on Raman's and Fluorescence spectroscopy. Some of the initial theoretical and experimental results will be presented in this paper.....Pg. 819

### THURSDAY, 27 September 12:45 - 15:00

TOM7 6185 010 STUDENT PRESENTATION Laser Induced Breakdown Spectroscopy for Identification and Quantification of Elemental Composition of Subsea Structures O. Ogboghodo, T. Thevar, University of Aberdeen, School of Engineering (GB). Laser Induced Breakdown Spectroscopy (LIBS) is a well established technique for material characterisation. However, there has not been a comprehensive study on the viability of using LIBS for subsea applications, in particular at high pressures of deep ocean. This paper will present some initial results of our work in this area....Pg. 821

### TOM7 6416 011 Post dea Multiplexing ability in digital holography for application to recording ultrashort phenomena

H. Hu<sup>1</sup>, P. Chavel<sup>1</sup>, Z. Ma<sup>2</sup>, H. Zhai<sup>2</sup>, Y. Yang<sup>2</sup>; <sup>1</sup>Laboratoire Charles Fabry, UMR 8501, Institut d'Optique, CNRS, Univ Paris Sud 11 (FR); <sup>2</sup>Institute of Modern Optics, Nankai University (CN).

The limiting factors to the number of independent images that can reasonably be multiplexed in one digital hologram are analytically and numerically investigated for the carrier wave angular multiplexing scheme. It is concluded that tens of frames are a realistic figure for the multiplexing capacity of typical current sensors. Pg. 823
